PREFACE.

MOST of the Tables in this Book were prepared for my own use so far back as 1859 I had long felt the want of some handy and ready means of calculating Indian dates, as the process described in Warren's Kâla Sankâhita and Prinsep's Useful Tables is both cumbrous and troublesome It struck me that, by substituting decimal parts of days for the Hindu *gharis, palas*, and *vipalas*, and by lessening the number of items to be taken out from the tables, the process would be made much more easy The road in both is the same, but I believe that I have made it both shorter and smoother The best test, however, of the advantage of my process will be to compare it with one of Warren's own examples for finding the initial day of both the Solar and Luni-Solar Calendars for the year of Kâli-Yuga 4923 complete = A.D 1822

The following is my process

SOLAR AHARGANA *Surya Siddhânta, Table XII*		LUNI-SOLAR AHARGANA *Surya Siddhânta, Table XIII*
4900 years =	1789,168 9067 days and	1736,398 5710 days
23 ,, =	8,400 9514 ,, ,,	8,150 4422 ,,
4923 years =	1798,168 8581 days and	1744,549 0132 days.

Deduct constant	2 1475	
Solar Ahargana	1798,166 7106 ÷ 7 = 6 7 or 7 days over = Friday, 12th April 1822,	
Luni-Solar Ahargana	1744,549 0132	1st day of solar year
	53,617 6974	
Dd 1800 Lunations	53,155 0582	
Table XIV	462 6392	
Dd 15 Lunations	442 9587	

Conjunction 19 6805 or 20 days earlier = Saturday, 23rd March
Beginning of Luni-Solar year 1 day later = Sunday, 24th March

The following is Warren's process See his **Kâla Sankâlita, p 240,** and Tables, pp 65 and 66

Wanted the beginning of the *Solar year* 4923 Kâli-Yuga, according to the Surya Siddhânta—

	Years	Days	G	V	P
	4000	1461,035	1	33	20
	900	328,782	52	51	0
	20	7,305	10	30	28
	3	1,095	51	29	22
		1798,168	51	29	22
Subtract Sodhyam		2	8	51	15
Divided by 7		1798,166	42	38	7

Remainder 6 over,

which, counted from Friday, gives *Suta-dina* = Thursday

[*N B*—Here *Thursday* is a misprint for *Friday*, as the large fraction of a day, upwards of 42 *gharis*, or more than two-thirds of a day, is practically a whole day, so that the remainder of 6 days + 42 *gharis* is reckoned as 7 days, as noted by Warren himself on page 65 at the foot of Example II, where he states that by the Surya Siddhânta the initial day is *Friday*]

Warren's Luni-Solar example is on page 66 of his Tables

Wanted the beginning of the *Luni-Solar year* 4293 Kâli-Yuga, according to the Surya Siddhânta—

Years.	Days				Years	Days	G	V	P
4923 =	1 798,166				4000	1417,468	13	16	49
(1)	1 754,549				900	318,930	20	59	17
	58,617				20	7,087	20	27	59
(2)	35,436				3	1,063	6	4	11
	18,181					1 744,549		48	17
(3)	17,718	(2)	100	Lunar years		35,436	42	19	55
	463	(3)	50	ditto		17,718	21	9	57
(4)	354	(4)	1	ditto		354	22	1	23
	109	(5)	3	Lunar months		88	35	30	20
(5)	88						—	—	—
Remainder	21					1 798,147	1	49	56
						+ 1			
					Luni-Solar Ahargana	1 798,148			
					Divide by 7				
						256,878 weeks + 2 days			

Remainder 2, counted from Thursday, gives *Saturday* for the Suta-dina, or day of conjunction.

In the tables for finding the corresponding dates for any Hijra day I believe that I have made the process more certain as well as more easy, by the adoption of a table, No XV, showing the number of each day in the Muhammadan year By this means the corresponding Christian day of any Muhammadan date can be ascertained with absolute certainty in a few minutes

The tables connected with the Christian year appear to me to be much simpler than any others that I have met with I prepared them for my own use in 1859, and I have since had so many opportunities of testing their accuracy as well as their easy working, that I have no hesitation in putting them forward as really useful and handy Tables

For the Tables of the Seleukidan era, I must crave some indulgence, as the subject is one of much difficulty, partly owing to the meagreness of trustworthy data, and partly to the adoption of the Julian reckoning in the western half of the Syro-Macedonian Empire after its annexation to Rome As my object is to treat of Indian eras only, I have retained the use of the cycle of Meton with its embolismic months, as I feel quite satisfied that the Julian reckoning was never adopted in the eastern provinces subject to the Bactrian Greeks and Parthians

The present work differs from others on the same subject, not only in the greater completeness as to the number of eras treated of, but also in the greater handiness and simplicity of its Tables for calculation I believe, therefore, that this "Book of Indian Eras" will help to supply a want, which has long been felt, in its numerous tables for the calculation of any Indian dates by easy and simple processes

The most useful works on Indian Measures of Time that I am acquainted with, are the following —

Warren's Kâla Sankâlita, 1825
Jervis's Weights, Measures, and Coins of India
Prinsep's Useful Tables, 1834
Cowasjee Patell's Chronology, 1866

Colonel Warren, who belonged to the French family of De Warenne, was one of the officers of the Great Trigonometrical Survey His work gives an elaborate exposition of the Hindu solar and luni-solar measures of time with an account of the Vrihaspati Chakra, or Jupiter cycle of sixty years, and a memoir on the lunar year of the Muhammadans At the end he has given a series of very useful tables for facilitating the computation of Indian dates The Kâla Sankâlita is valuable for its accuracy, but its Tables are rather cumbrous and troublesome for any large number of calculations My own Hindu Tables are simpler and

easier to work with than Warren's, but they are essentially the same, and were, in fact, based upon his elaborate and more cumbrous processes

Jervis's Measures of Time form only part of his large work on Indian Weights and Measures His Muhammadan calendar is excellent; but his list of the corresponding years of the Vikramâditya Sambat is entirely vitiated by his adoption of the wrong initial point of the era as 56 B C, instead of 57 or 56¾ His account of the 60-year cycle of Jupiter is limited to the corrupt form in use in Southern India

James Prinsep's Useful Tables are founded almost entirely on Warren's Kâla Sankâhita But his tabular forms are much more handy than those of Warren, and his calendric scales for ascertaining corresponding dates by simple inspection are a really useful invention. For his own use he had wooden cylinders prepared round which the scales were pasted, so that the initial day of any Hindu or Muhammadan year could be set at once to its corresponding date in the Christian calendar. There are several misprints, but the only serious one is in the table of Hindu sidereal years, where the initial days of the Christian years on the left hand from A D 1753 onwards are continued in Old Style, while the initial days of the corresponding Hindu years are given in New Style right down to the end Thus the present year A D 1882 is made to begin on Friday (which is O S), instead of on Sunday (N S), while *Tuesday* the 10th April is given as the beginning of the Hindu year in N S

Cowasjee Patell's Chronology is an extremely useful practical work, as it gives a large number of corresponding lists of years of different eras "in use among Parsis, Jews, Greeks, Hindus, Muhammadans, Chinese, Japanese, &c The brief accounts of the eras are generally taken from Prinsep, as well as the rules for calculating the dates The Tables are singularly free from misprints, but whilst I was calculating my own Tables and comparing them with his, I found the following errata, which may be worth noting by all those who possess a copy of his work

In A D 141 and again in A D 543, the name of the intercalary month has been omitted

In A D 999, *for* 19th March, *read* 21st March
——— 1168, *for* 15th March, *read* 12th March
——— 1169, *for* 4th March, *read* 1st March
——— 1344, *for* 15th March, *read* 16th March
——— 1597, *for* 7th April, *read* 7th March
——— 1655, *for* 26th February, *read* 28th March.
——— 1899, *for* 1st April, *read* 11th April.
——— 1983, *for* 15th April, *read* 13th April.

A very curious coincidence of dates came accidentally to my notice

during the past cold season At Boram Deo in the Central Provinces I found several inscribed Sati Pillars, two of which gave the name of the year of the 60-year cycle of Jupiter in addition to the Samvat date These two inscriptions are recorded as follows —

A —Swasti Samvat 1430 samayo
Sidharthi nâma Savachhara

B —Samvat 1445 Bhava nama
Samvatsara Aswina badi 13 Some

As Boram Deo is in Chattisgarh or Mahâ Kosala, which formed the old kingdom of the Chedis or Kalachuris, I thought it most probable that these dates were reckoned in the Chedi or Kalachuri Samvat of which the initial point, as I have previously shown, was A D 249 = 0 Reckoning from this starting point, the date of A would be 1430 + 249 = 1679 A D, which was actually the year Sidhârthi, according to the computation of the cycle in use in Southern India

Similarly the date of B would be 1445 + 249 = 1694 A D, which was actually the year Bhâva of the Southern reckoning

Here then I thought that I had found a clear proof that the Chedi or Kalachuri era had continued in use down to A D 1694 But when I proceeded to calculate the week day of B, I found that it did not agree with A D 1694 It then struck me that the Samvat might be that of Vikramâditya, according to which the date of A would be 1430 — 57 = 1373 A D, which to my surprise proved to be also the year Sidhârthi of the Northern reckoning of the 60-year cycle Similarly the date of B would be 1445 — 57 = 1388 A D, which was also the year Bhâva of the Northern reckoning On calculating the week day of B, I found that it agreed exactly with the Vikramâditya Samvat, as the 13th of Aswina-badi in Vik Sam 1445 was actually a Monday Without this mention of the week day, the true equivalent of these two dates would, therefore, have been doubtful, and I should certainly have been inclined to refer them to the Chedi era

Of course, this coincidence could only happen within the limit of the 86-year period in which these two dates are included, as the omission of every 86th name of the Jupiter Cycle in the Northern reckoning would make all the earlier northern names later, and all the latter ones earlier

Since the text of this book was printed, a notice of my attempt to fix the date of the Gupta era has been published by Dr Thibaut, Principal of the Benares College* His remarks are confined to the calculations

* *Indian Antiquary*, Vol XI, p. 322

based on the 12-year cycle of Jupiter, as he considers it highly probable that the modern system of Hindu astronomy, with its fairly accurate knowledge of the planetary revolutions, "was not well established before A D 400" This I fully admit as far as the existing Siddhântas are concerned But the fact that the Macedonian months were in use in Northern India, certainly during the 1st and 2nd centuries A D, offers, in my opinion, a clear proof that the people of North-Western India had adopted the Macedonian era of the Seleukidæ Now the Greeks of Alexander's army must have brought with them the calendar of Meton, which was a luni-solar cycle of 19 solar years of 365¼ days each, or 235 lunar months * But this is the very cycle that is still used by the Hindus themselves, and I have very little doubt that they must have corrected the old erroneous reckoning of Garga by the Greek calendar of Meton

If this conclusion be right, then the Hindus of the 1st and 2nd centuries A D must have had a nearly accurate knowledge of the length of the solar year, the amount of error being only one day in 76 years It seems to me, therefore, not improbable that a fairly accurate adaptation of the cycle of Jupiter to the reckoning of the solar year may be as old as the time of the Indo-Scythians, who made use of the Macedonian calendar in their inscriptions Of course this is not a proof that the reckoning of the Arya and Surya Siddhântas was in use at so early a period But it is, in my opinion, a very strong argument that a nearly accurate reckoning must already have been adopted

I am perfectly aware that the date of the Gupta era is still unsettled, but there is one fact that is strongly in favour of the early period that I have arrived at,—namely, the date of A D 319, which is assigned by Abu Rihân for the extinction of the Gupta dominion Now the last of the great Gupta kings was almost certainly Skanda Gupta, and as we have a copperplate inscription dated in the year 146, during his reign, the initial point of the era cannot well be placed later than 319—146=173 A D, that is within seven years of my proposed date I, therefore, adhere for the present to the year 166 A D as a convenient date, which cannot be far from the truth In fact the two inscriptions of King Jaika, if they belong to the same person, are very strongly in favour of my date One of these is dated in the year 794 of the Vikramâditya Samvat, or A D 737-38, and the other, from Morbi, is dated in 595 of the Gupta era Deducting 595 from 738, we get the year 143 A D, which is 23 years earlier than my date But if we accept my date as a near approximation to the truth, we obtain 166 + 595 =761 A D, as the date of the

* See my account of the Seleukidan era in this volume

Morbi inscription, which would give King Jaika a reign of 23 years from 738 to 761 A D *

In Table XVIII I have added a list of eclipses, both lunar and solar, from the beginning of the Christian era down to A D 2000 These have been taken from the celebrated French work "L'Art de verifier les dates"—Vol I, 8vo, 1818 In the original work the hour of each eclipse is given for the meridian of Paris These I have omitted for want of space While copying out the dates, I have noted a few errors and omissions, namely —

A D 1341, *for* Lunar Eclipse, 13th May, *read* 31st May
A D 1392 *for* Lunar Eclipse, —— Sept, *read* 2nd Sept
A D 1488, *for* Solar Eclipse, 9th July, *read* Lunar
A D 1916, *for* Lunar Eclipse, 8th January, *read* 18th

To show how easy it is to make mistakes in dates, it will be sufficient to state that the Emperor Bâber has given the wrong date for his own famous battle of Khânwa, in which he defeated Râna Sangrâm of Mewâr Bâber says that it took place on Saturday, the 13th of the second Jamâdi, A H 933, which both Erskine and Dowson make the 16th March A D 1527 † That the name of the week day is correct we learn from Shekh Zein-uddin, who repeats the name in the following quotation from the Korân "Since God has given a blessing on your Saturday" But the 13th of the second Jamâdi was a Sunday as will be seen from Bâber's own statements of other dates in the same year Thus he calls—

24th Muharram 933	a	Wednesday
15th Safar ,,		Wednesday
16th Rabi I ,,		Friday
9th Jamadi I ,,		Monday.
14th ,, ,,		Saturday

All of these dates bring us to Monday as the 30th or last day of Jamâdi I, and to Tuesday as the 1st of Jamâdi II Consequently, Saturday was the 12th and not the 13th of that month—a fact which has escaped the notice of both Erskine and Dowson

With reference to the intercalary months of the Hindu luni-solar year, I may mention that there is a great divergence between the published lists of Jervis and Cowasjee Patell ‡ At page 91 I have quoted the native rule as given by Warren and Prinsep, and the following example will show that the table published by Jervis is certainly wrong

* For these two inscriptions of Jaika, see my accounts of the Gupta and Vikramâditya eras in this volume

† Baber's Memoirs, translated by Erskine, p 258

‡ Jervis's Weights, Measures, and Coins of India, p. 94, Cowasjee Patell's Chronology.

In the Saka year 1091, or A.D 1168, the month of Srâvana was intercalary as recorded in an inscription of Vyaya Pandya Deva * At that date the luni-solar year began on the 1st March, and the solar year on the 24th March The 23rd March was, therefore, the 31st day of the solar month of Chaitra, and the 1st March was the 8th day of the solar Chaitra Now, according to the native rule when the luni-solar year begins on the 6th, 7th or 8th of the solar month of Chaitra, then the month of Srâvana will be intercalary Turning to my Table XVII, page 175, it will be seen that in the year A D 1168, or Saka 1091, the month of Srâvana was intercalary That it was an intercalary year is proved absolutely by the initial date of the following year Saka 1092, which is 20 days later, and therefore the year 1091 just ended must have consisted of 13 lunar months

But Jervis makes the year 1091 Saka a common year, and assigns the intercalary month of Srâvana to the year 1093 Saka The Patell's year of intercalation are correct, and so also are his names of the intercalary months so far as I have had leisure to test them

N B—Page 45—add at foot

If the correction of Kallippus of 1 day in 76 years had been adopted by the Seleukidæ, then the year 2 of their era would have begun on the 2nd October 312 B C, and every succeeding 77th year would also have begun on the same day of the corresponding Christian year. Thus the following years of the Seleukidan era would all have begun on the 2nd October —

An Sel	1,	77,	153,	229,	305,	381,	457,	533,	609
In B C	312,	236,	160,	84,	8,	A D 69,	145,	221,	297

The fact that the battle of Arbela was fought on the 2nd October 331 B C, near the end of the month of Gorpiæus, shows that the Macedonians of Alexander's army had not adopted the corrected Calendar of Kallippus, otherwise the 2nd of October would have been the 1st of Hyperberetæus

N B—P 95—add the following paragraph —

When the given date falls in an intercalary year *after* the intercalary month, then 30 days must be added to the number of days given in Table X. Thus, if the given date should be 10th Mâgha-sudi and the year be an intercalary one, 30 days must be added to the number of 305 days given in the Table, unless the intercalary month should happen to be Phâlguna, which being later in the year, would not affect the month of Mâgha

BOOK

OF

INDIAN ERAS.

ANCIENT INDIAN MODES OF RECKONING TIME

THE natural divisions of time—years, months, and days—have, in all ages, been determined by the motions of the sun and moon In India the day was reckoned from sunrise to sunrise, the month, from one moon to another moon, and the year, from the beginning of one season until its return

The most ancient year probably consisted of 360 days, which approximated roughly to twelve revolutions of the moon and one of the sun In one of the hymns of the Rig Veda the sun's annual course through the heavens is described as his *twelve-spoked wheel** The 360 days, with as many nights, are called his 720 children In another part of the same hymn the sun's annual course is somewhat differently described "The felloes are 12 the wheel is 1, 3 are the axles within it are collected 360 spokes"† Here the spokes represent the number of days the axles are the three seasons of Heat, Rain, and Cold, and the 12 felloes are the 12 months

But the great difference of 11 days between 12 lunations and 1 revolution of the sun must soon have led to the establishment of the old cycle of 5 solar years and 62 lunations Taking the solar year at 365¼ days, and the moon's revolution at 29½ days, the 5 solar years would have been 1826¼ days, while the 62 lunations would have been 1829 days The difference of 2¾ days in the lustrum of 5 years would have made a yearly difference of upwards of half a day The five years consisted of three ordinary years of 12 lunar months, and of two years, the 2nd and 5th, each with an intercalary, or thirteenth month

* So also in the Surya Siddhânta, xii, 19, Varâha Mihira speaks of the year as a 'wheel

† Wilson's Rig Veda, II, 143, and also II, 131

This intercalary, or thirteenth month, is very plainly alluded to in the Rig Veda,* where Varuna is said to know the 12 months, "and that which is supplementarily engendered," or, as Dr Max Muller has it "He knows the 12 months with their offspring, and knows the month which is produced in addition" †

Dr Max Muller also notes that, "In the hymns of the Yajur Veda the 13th month is changed already into a deity Oblations are offered (Vâjasan Sanhitâ, VII, 31) to each of the twelve months, and at the end one oblation is made to Anhasaspati, the deity of the intercalary month. In the Brâhmanas likewise the thirteenth month is mentioned, and in the Jyotisha the theory of intercalation is fully explained" It seems certain therefore that the intercalary month was well known as early as the Vedic Period

Each year of this five-year cycle, or lustrum, had a separate name This important fact was first made known by Colebrooke from the White Yajur Veda The same names are also given by Varâha Mihira, who says ‡ "The first year of each lustrum, called *Samvatsara*, is (ruled by) Agni, the second, *Parivatsara*, by the Sun, the third, *Idâvatsara*, by the Moon, the fourth, *Anuvatsara*, by the Creator, and the last, *Udavatsara*, by Rudra" But the passage in the Yajur Veda goes on to say "May mornings appertain to Thee, may days and nights, and *fortnights*, and months, and seasons, belong to Thee" Here then we see that, as early as the time of the Yajur Veda, the whole system of lunar months, with their light and dark fortnights, and of intercalary months, to adapt the lunar months to solar reckoning, had already been established §

We have another testimony to the early use of the lunar fortnights in a passage of Quintus Curtius, whose information must have been obtained from some of the writers who accompanied Alexander the Great ‖ "Their months consist of fifteen days, but they keep the

---

* Wilson's Rig Veda, I, 65

† History of Ancient Sanskrit Literature, p 212

‡ Dr Kern's Translation of the Brihat Sanhita, C VIII 24

§ Yajnavalkya also [C II, 6] says, that a petition made to the king should give the year, month, *half month*, and day

‖ Vita Alexandri, C VIII, 9 "Menses in quinos denos descripserunt dies anni plena spatia servant Lunæ cursu notant tempora, non, ut plerique, cum orbem sidus implevit, sed cum se curvare cœpit in cornua"

full year They reckon time by the course of the moon, not as most people do, but by half-moons"

We also learn the same thing from the inscriptions of Asoka, which are about eighty years later than Alexander Thus in the separate edicts at Dhauli we find mention of the month of Tishya (*Mâsi-cha Tise*) of the lunar fortnight (*athami pakhaye*, or the 8th day of the *paksha*), and of the three seasons (*tisu chatum-Mâsisu*, or the three four-monthly periods) On three days the slaughter of animals also is forbidden, namely, on the day of 'fullmoon,' *punnamâsi* (called also *pannadasam*, or the 15th day), on the 14th day, and on the day after the conjunction

The old year was divided into three seasons of Heat Rain, and Cold, called *Grishma*, *Varsha*, and *Hemanta*,—all of which names are found in the Indo-Scythian inscriptions They are also commonly known as *Dhûp-kâl*, *Barkha-kâl*, *Sît-kâl* * So in Ceylon the rainy season, or *Wasso*, still consists of four months, and extends from July to November In ancient times, however, *Wasso* or *Varsha* extended from June to October, but owing to the greater length of the Indian year the seasons fall back about one day and-a-half in every hundred years At the present time the solar year begins on the 13th of April instead of on the 21st of March In consequence of this difference the beginning of *Varsha*, or the rainy season, in the times of Alexander and Asoka, would have fallen just one month earlier than at present

In the Indo-Scythian inscriptions from Mathura, the fortnights are not designated as light and dark or the waxing and the waning of the moons, but are numbered throughout each season as the 1st, 2nd, 3rd, &c, fortnights of the hot, the rainy, or cold season Thus one of Vasudeva's inscriptions is dated in

Sam 83—*Gr* 2—*Di* 10

that is, *Samvatsara* 83, *Grishma* 2 *Paksha*, *Divasa* 10, or, "on the 10th day of the 2nd fortnight of Grishma in the year 83" But as the names of the Hindu months of Chaitra, Vaisâkha, Ashâdha, and Srâvana are found in the Indo-Scythian inscriptions from Gândhâra, along with the Macedonian names of Daisios, Apellaios, and Artemisios, during the reigns of Kanishka and Huvishka, it is difficult to say which of the

* Abul Fazl, Gladwin's Translation of Ain-i Akbari, I, 266, gives these three names, and significantly adds, "throughout Hindustan they do not reckon more than three seasons of the year."

two systems of naming the lunar fortnights may be the older I have a suspicion, however, that the indigenous nomenclature may have been by numbering and that the other method of waxing and waning fortnights may have been borrowed from the Greek *μηνος ισταμενου* and *μηνος φθίνοντος*

The oldest eras described by the astronomers are the *Saptâ rshi-Kâl*, or cycle of the seven Rishis, the *Bârhaspatya-Mânas*, or sixty and twelve year cycles of Jupiter, and the *Kâli-Yuga*, or beginning of the Kâli-Age Not one of these mounts up to the exaggerated periods of thousands of millions of years like the monstrous systems invented by the astronomers The oldest of them, the *Saptâ rshi-Kâl*, ascends only to B C 4077, or perhaps to 6777 B C, while the *Bârhaspatya-Mâna* and the Kâli-Yuga reach only a little beyond 3000 B C In Alexander's time the Hindus did not claim a greater antiquity than B C 6777 I have therefore a very strong suspicion that the present extravagant system of Yugas and Mahâyugas, Manwantaras, and Kalpas, was an invention of the astronomers, which they based on their newly-acquired knowledge of the precession The problem was a simple one Given the precession of 49 8 seconds, as determined by Hipparchus, the period of one revolution through the whole circle of 360° would be $26{,}024\frac{16}{166}$ years To obtain a whole number of years the fraction was got rid of in the usual way by multiplying 26,024 by 166, and adding 16 to the product, a process which gives a period of exactly 4 320,000 years, or just one *Yuga*

It may be objected that the Hindu astronomers did not adopt the precession of Hipparchus But this will not alter the case, as their own determinations of the precession give precisely the same result The precession fixed by Parâsara is 46 5 seconds, and that of Aryabhata 46 2 seconds Following the same process as before, we obtain for Parâsara a $27{,}870\frac{150}{155}$ years as the period of one revolution, and $28{,}051\frac{126}{154}$ years for Aryabhata, both of which periods give the same whole number of 4,320,000 years. Exactly the same result is also obtainable from the European precession of 50 1 seconds, which gives a period of $25{,}868\frac{44}{167}$ years for one revolution, and a whole number of 4,320,000 years

But if this be the true origin of the Hindu *Yuga* and the monstrous system of *Mahâyugas*, *Manwantaras*, and *Kalpas*, it follows that some other mode of reckoning must have been in use before the Christian era Now the only early eras used in Northern India, of which detailed accounts still remain, are the cycle of the seven Rishis, the two cycles of Jupiter,

and the Kâli-Yuga The Saptârshi-Kâl is unknown in Southern India, but the Kâli-Yuga and the 60-year cycle of Jupiter are well known, besides the two cycles of Parasurâma and Grahaparivritti, which are peculiar to Southern India The eras of Buddha and Mahâvira, both of which are prior to Vikramâditya, must have been used by the Buddhists and the Jains at an early period The former was certainly current amongst the Buddhists in the time of Asoka, and the latter was probably in use about the same period In the Mathura inscriptions of the Indo-Scythian kings, which are found upon the statues of both Jains and Buddhists, the dates are invariably expressed in an era which may have originated with Kanishka, but which was most probably only an Indian adoption of the Seleukidan era as suggested by Mr Thomas

In dealing with Indian dates there is one fact that must never be forgotten, namely, that every year that is mentioned by number, that number refers to years actually elapsed, just as Europeans reckon their ages When a man says that he is 50 years old, he means literally that 50 full years have passed since his birth, and that he is then in his 51st year So when a Hindu records the year 80 of the Vikrama Samvat, or any other era, he means that 80 full years of that era have actually elapsed, and that the current year is the 81st

Only one inscription to my knowledge has yet been found dated in any of the intercalary months This is no doubt due to the entire want of festivals in these months, and as grants of land are usually made on the festival days, there are of course few inscriptions recorded in the intercalary months

I.—SAPTÂRSHI-KÂL ;

OR,

CYCLE OF THE SEVEN RISHIS

The Sapt-Rishi-Kâl, or "Cycle of the Seven Rishis," called also the *Saptârshi* and *Sat Rikhi Kâl*, is so named after the seven stars of the constellation of the Great Bear It is the only mode of reckoning employed in the Râja Tarangini, or History of Kashmir, and it is still used in the hill states to the south-east of Kashmir between the Chenâb on the west and the Jumna on the east The general use of this cycle did not escape the notice of Abu Rihân, who has preserved much valuable information regarding the different centenary cycles in use at the time of Mahmud's invasion of India

"In India," he says, "the vulgar reckon by ages, and these ages follow one after another This they call the *Samvatsara* of a hundred When one century is passed they drop it, and begin another They call this the *Lok-Kâl*, or 'People's Era'" * Now this last is the same name that is used by Kalhana Pandit of Kashmir, who says †

Laukikebde chaturvinsate Sakakâlasya sampratam
Saptatyâtyadhikam yâtam sahasram parivatsarah

"The 24th year of the *Laukika* corresponds with the year 1070 of the Saka-Kâl"

From this statement we learn that the year 1 of the *Laukika* coincided with 1047 of the Saka, or A D 1025, and as the cycle was a centenary one, the first year of each century must have corresponded with the 25th year of each Christian century This is placed beyond all doubt by the following facts —

1 —In the Temple of Baijnâth, in the district of Mandi, there is an inscription which bears the two dates of Saka 726 and Lok-Kâl 80 Deducting 79 from each date we obtain the Saka year 647, or A D 725, as the first year of the Lok-Kâl century

* Reinaud, Fragments Arabes et Persans, p 147
† Râja Tarangini, I, 52

2.—Captain Patrick Gerard of the Gorkha Battalion, then stationed at Kotgarh on the Satlej, heads one of his notes as follows —"*Kacha Sambat*, or year 2, or 1826-27, Kotgarh, June 25th, 1826" By this account the year 1825 A D was the first of the *Kacha Sambat*, or *Sapt-Rishi-Kâl*, of 100 years

I first became acquainted with the survival of this mode of reckoning in 1846, when I was employed in the Kangra district It was commonly called the *Sat-Rikhi-Kâl*, but was also well known as the *Pahâri Samvat*, or "Hill era" In the same year I obtained further information about it from Wazir Gusâun, the astute minister of the Mandi state, who accompanied me to Ladâk From him I learned to read the dates on the Sati Pillars of the Mandi Râjas Again, in 1859, on my return from Burma, I made new enquiries in Kashmir and Kângra, in Mandi and Kullu, as well as in Kotgarh and Râmpur on the Satlej I then found that the Pandits of Kashmir still preserved the fanciful mode of reckoning the Lok-Kâl, which was invented by the astronomers, and afterwards adopted by Kalhana Pandit in the Râja Tarangini All other accounts agree in making the Sapt Rishi cycle older than the Mahâbhârata But the astronomers differ altogether from the common opinion which has been generally adopted throughout India According to the almost universal belief of the people the period of the Great War, or the era of Yudhishthira, was also the beginning of the Kâli-Yuga That this was also the popular belief in former days is proved by the explicit statement of Abul Fazl,* that "In the beginning of the fourth or present *Yuga*, Râjâ Yudhishthira was universal monarch, and the commencement of his reign became the epoch of an era, of which to this time, being the fortieth year of the reign, there have elapsed 4696 years" Now the fortieth year of Akbar was A D 1595, which, deducted from 4696, gives B C 3101 as the period of Yudhishthira as well as of the Kali-Yuga In another place also he states that the Mahâbhârata was "carried on in the latter end of the Dwâpara-Yuga And in a third place he says that the war happened one hundred and five years before the end of the Dwâpara-Yuga, and 4891† years before the fortieth year of Akbar But Abul Fazl had also heard of the date invented by the astronomers, as near the close of his work he places the reign of Kansa, râjâ of Mathura, 'above 4000 years before the fortieth of Akbar," that is between 2400 and 2500 B C

* Gladwin's Ain-i-Akbari, I, 263 see also II, 88 91

† This number should be 4801, or 4696 + 105, and not 4891.

On one point all accounts agree—namely, "that the Munis (or Seven Rishis) were in Maghâ when king Yudhishthira reigned over the earth" * But the popular belief assigns the same position of the Seven Rishis to be beginning of the Kâli-Yuga also

According to the astronomers the era of Yudhishthira varied from 600 to 666 years after the beginning of the Kâli-Yuga But their determinations depend on such groundless assumptions that they can only be looked upon as mere astronomical fancies Both Parâsara and Aryabhata assume that the revolutions of the Seven Rishis began with the commencement of the Kalpa of 4,320 000,000 years, and that the number of their revolutions in this period was 1 599,998 But they differ slightly in the number of years elapsed before the beginning of the Kâli-Yuga, which the former makes 1,972 944,000, while the latter has 1,969 920,000 According to Parâsara—

As 4 320 000,000	1 972 944,000	1 599,998	730,719 0866
or 10,000	4567		

that is, at the beginning of the Kâli-Yuga the Seven Rishis had accomplished 730,719 complete revolutions plus 0866 of a revolution Multiplying this fraction by 2,700 years, or one whole revolution, we get years 233 8200 of a revolution expired before Kali-Yuga began Then as the Great War took place when the Seven Rishis were in Maghâ (the 10th Nakshatra), we must deduct the 233 82 from 900, by which we obtain 666 18 years of Kâli-Yuga expired at the date of Yudhishthira

By a similar process for Aryabhata, we get 662 4 years of Kâli-Yuga expired as the date of Yudhishthira, and by repeating the process for Varaha Mihira, we get 653 Kâli-Yuga as his date of the Mahâbhârata The last is the date adopted by Kalhana Pandit, who says † "When 653 years of the Kâli-Yuga had expired, the Kurus and Pândavas flourished"

This fanciful date invented by the astronomers is noticed by Abu Rihân as the *Pându-Kâl*, or "era of the Pandus," which was different from the Kâli-Yuga, but he omits to mention its starting point ‡

The theory of the astronomers is in direct opposition to the explicit statements of the Purânas, which are in complete accord with the common belief § Thus the Vishnu Purâna says —"When the first two

* Raja Tarangini, I, 56 † Raja Tarangini, I, 51

‡ Reinaud, Fragments Arabes et Persans, p 137

§ Vishnu Purana, IV, C. 24, or Hall's Edition, Vol. IV, p. 283

stars of the Seven Rishis (the Great Bear) rise in the heavens, and some lunar asterism is seen at night at an equal distance between them, then the Seven Rishis continue stationary, in the conjunction, for a hundred years of men. At the *birth of Parikshit* they were in *Maghâ*, and the *Kâli-age then commenced*, which consists of 1200 (divine) years When the portion of Vishnu (that had been born from Vasudeva) returned to heaven, then the Kâli-age commenced"*

The Bhâgavata Purâna agrees with the Vishnu Puiâna in placing the Seven Rishis in Maghâ at the time of the Great War Thus Suka, *addressing Parikshita*, says "Of the Seven Rishis, two are first perceived rising in the sky, and the asterism, which is observed to be at night even with the middle of those two stars, is that with which the Rishis are united, and they remain so during a hundred years of men *In your time*, and *at this moment*, they are situated in Maghâ'

"When the splendour of Vishnu, named Krishna, departed for heaven, then did the Kâli-age, during which men delight in sin, invade the world So long as he continued to touch the earth with his holy feet, so long the Kâli-age, comprising 1200 (divine) years, began" So also Nrisimha "expounds the Sâkalya Sanhita, and rejects Varâha's rule as disagreeing with the Purânas"†

Varâha himself quotes Vriddha Garga for his account of the cycle of the Seven Rishis‡ His words are "1, 2 I shall tell, according to the theory of Vriddha Garga, the course of these Seven Seers, by whom the northern region is, as it were, protected, through whom she shines, as if adorned with a string of pearls, like a maiden with joyful countenance, wearing a wreath of white water-lilies, those Seven Seers, by the turning round of whom the northern region seems dancing, the pole-star being the regulator.

"3 The Seven Seers were in Maghâ when king Yudhishthira ruled the earth, and the period of that king is 2526 years before the Saka era

"4 They remain moving for a hundred years in each lunar mansion, and rise constantly in the north-east, together with Arundhati"

---

* Wilson's Vishnu Puiâna by Hall † Colebrooke's Essays, II, 313-14-15.

‡ Dr Kern's Translation of the Brihat Sanhita, C xiii, 1—4

But unluckily for Varâha Mihira his commentator, Bhatta Utpala, has given us the very words of Garga, who simply says *

"At the *junction of the Kâli and Dwâpara ages*, the virtuous sages, who delight in protecting the people, stood at the asterism, over which the Pitris preside (that is *Maghâ*)"

On comparing this quotation with Varâha's statement, we see at once that he has suppressed Garga's mention of the beginning of the Kâli-Yuga to suit his own astronomical fancies Now Garga states most explicitly that the Seven Rishis were in Maghâ at the beginning of the Kâli-Yuga, and says nothing whatever about Yudhishthira But the fact that the Rishis were in Maghâ at the time of the Great War was too well known to be altered, and so Varâha accepts this, while he quietly ignores Garga's statement about the Kâli-Yuga Well might Nrisinha reject "the teaching of Varâha as differing from the Purânas"

The quotations which I have already given from Abu Rihân and Kalhana Pandit show that the fanciful vagaries of the astronomers regarding the date of the Mahâbhârata had already been partially adopted in the 11th and 12th Centuries A D But the learned Muhammadan author goes on to show that the use of the Sapt-Rishi cycle had certainly extended to Multân and Sindh † He says, that "writers differ with regard to the beginning of the year as well as with regard to the initial point of the cycle" He states also that he has "seen the Indians, when they wished to mark the date of the taking of Somnâth, write down 242, 606, and 99, and then add them together, which gives the year of Saka Abu Rihân explains that 242 shows the number of years (of Saka) which preceded the epoch when the Indians first began to use the centenary cycle, and that this usage commenced with the era of the Guptas Further, that the sum of 606 shows the number of complete centenary cycles of 101 years each, and lastly, that 99 is the number of years elapsed of the current cycle" These numbers added together give 947 as the year of Saka in which Somnâth was captured, equivalent to the year beginning in April A D 1025, and ending in April 1026, which is correct, as Somnâth fell in January 1026

In confirmation of the accuracy of this process Abu Rihân quotes the following formula from the astronomical tables of Durlabha of Multân —"Set down 848 and add the Lok-Kâl or vulgar reckoning, the sum will show the year of the Saka era" Abu Rihân then gives

* Colebrooke's Essays, II, 313 † Reinaud, Fragments Arabes et Persans, p. 147

the following example —"Set down the actual date (year 953 of Saka in which he was writing) of Saka, and deduct 848, the remainder 105 will be the Lok-Kâl, and the year of the fall of Somnâth will be 98"

In the first example, the capture of Somnâth is assigned to the year 99 of the Lok-Kâl, and in the second example, to the year 98 but the latter is no doubt a mistake for 99

As the Lok-Kâl of this description differs from that which has been in use for many centuries throughout Kashmir and all the hill states of the Punjâb and Cis-Sutlej districts, it appears to me either that the Lok-Kâl of Sindh and Multân must have had a different starting point from that of Kashmir, or that Abu Rihân must have been puzzled by conflicting accounts which he obtained from various persons who, perhaps, had but little knowledge of the subject The latter, I conclude, to have been most probably the case, as Abu Rihân candidly acknowledges the imperfectness of his account and warns the reader that the results which he gives are uncertain, as several of the numbers (of the centenary cycles) exceed 100

The Lok-Kâl, or "common era," called also the *Sapt-Rishi-Kâl*, or "era of the Seven Rishis," is a cycle of 2700 years divided into twenty-seven centenary periods, a new reckoning being started at the beginning of each century The theory of the cycle is, that the Seven Rishis, or stars of Ursa Major, remain for one century in each of the twenty-seven *Nakshatras*, or lunar mansions All authorities agree in making Aswini the first of the Nakshatras, and in stating that the Mahâbhârata took place when the Rishis were in the lunar constellation Maghâ, the tenth of the series The Purânas, and the practice of all the people who still use this cycle, excepting only the Kashmiris, agree in making the era of Yudhishthira the same as the Kâli-Yuga All, however, agree in stating that, at the time of the Mahâbhârata, the Seven Rishis had already passed 75 years in Maghâ But as Varâha places the Great War 653 years after the beginning of the Kâli-Yuga, or in 2449 B C, that year should have been the 76th of the tenth Nakshatra, and the 976th year of the cycle This would fix the first year of each centenary period to the 25th year of each century B C, and to the 76th year of each century A D But to prevent the confusion that would thus have arisen, Varâha simply ignored the generally accepted belief that the Rishis had spent 75 years in Maghâ when the Mahâbhârata took place and retained the initial points of the Saptârshi centuries—only bringing Maghâ down

from B C 3177 (or 3102 + 75) to B.C. 2477 Accordingly, Varâha's followers place the initial point of the Vrihaspati Chakra in 3377 B C in Aswini, so that each century begins in the 26th year of each century of the Kâli-Yuga exactly as Dr Buhler was informed This also accords with the statement of my Kashmiri informant that the Rishis had completed three revolutions less 25 years in the Dwâpara-Yuga before the Kâli-Yuga began, that is, their Chakra preceded the Kâli-Yuga by 275 years, equivalent to B C 3377, or 3102 + 275 years

The following is a translation of the reply which I received from the Brahmans of Kangra in A.D 1859 regarding the *Sapt-Rishi-Kâl* — At the beginning of the Kâli-Yuga, the Seven Rishis (or Stars of Ursa Major) had been 75 years in one Nakshatra (Maghâ), and they remained in the same for 25 years longer These 25 years are the amount of difference between the total number of Kâli-Yuga years elapsed and the number of centuries or years of the Hill cycle [*Pahâri Samvat*] up to the present date Thus the present year, 1859 of the Christian era, is Kâli-Yuga 4960, and 35 of the 50th Hill cycle, or exactly 25 years short of the number of Kâli-Yuga years"

From another informant I received the following account —"The Seven Rishis remain for one hundred years in each Nakshatra They entered into Maghâ 75 years before the beginning of the Kâli-Yuga, and they remained in Maghâ for 25 years of the Kâli-Yuga," that is until 3077 B C., when they entered into another Nakshatra

Similar information was received from the Brahmans of Mandi and Bisahar. But from Kashmir the reply was somewhat different. It was obtained by Mirza Saifuddin after consultation with pandits and astronomers "The present year 1859 is 4960 of the Kâli-Yuga, and Samvat 35 of the Haft Rikheshar The Kâli-Yuga is said to be 25 years in advance of the Haft Rikheshar The seven stars complete one revolution in each Nakshatra in 100 years When they had completed three revolutions less 25 years in the Dwâpara-Yuga, then the Kâli-Yuga began, and only 2425 years of the first Chakra belong to the Kâli-Yuga Each whole period of 2700 years is called a *Chakra*, or cycle, in which the Seven Rishis pass through the 27 Nakshatras from Aswini to Revati. Of the second Chakra of 2700 years 25 Nakshatras were completed in the Christian year 1825, or 4926 Kâli-Yuga" This tallies exactly with the information lately obtained in Kashmir by Dr. Bühler, who writes. "I have found in the manuscript several more dates in the Saptrishi

era with the thousands added, and all agree with the verse which places the beginning of the era in *Kâli 26*, Chaitra-sudi 1" In these accounts from Kashmir the computation of Varâha Mihira is adopted, which places the era of Yudhishthira in 653 of the Kâli-Yuga, when the Seven Rishis are said to have been in Maghâ, in direct opposition to the commonly received reckoning which places the era of Yudhishthira at the beginning of the Kâli-Yuga

The informants in Kangra, Mandi, and Bisahar agreed with the Kashmir correspondent in fixing the beginning of the year at the *navâtra*, or new moon of Chaitra, that is Chaitra-sudi 1

So universal is the belief that the date of the Kâli-Yuga is the same as that of the Mahâbhârata, that the native almanacs state it as a positive fact Thus Professor Bhândârkar quotes the following from an ordinary Hindu Panchânga of Bombay "In the Kâli-age there are six founders of eras First, there was Yudhishthira in Indraprastha, whose era lasted for 3044 years The second was Vikrama at Ujayani, whose era had a run of 135 years The third was Salivâhana at Pratisthâna" Here the era of Yudhishthira is made the same as that of the Kâli-Yuga which also dates from 3044 years before the era of Vikrama

The first mention of the Lok-Kâl, or cycle of 100 years in the Râja Tarangini, is the year 89, corresponding with A D 813-14 Before this period only the lengths of reigns are given, but from A.D 813 downwards the date of each king's death is carefully recorded, with the name and day of the month as well as the year of the cycle

I have been thus particular in pointing out the true beginning of each century period of the Lok-Kâl or Sapt-Rishi Chakra in the year 25 of each Christian century, because both Troyer and Wilson, after translating correctly Kalhan's statement that the year 24 of the *Laukika* coincided with 1070 of the Saka (or A D 1148) have most deliberately and unaccountably thrown over the native historian's statement and adopted some fancied dates of their own Thus the 89th year of the Kashmirian cycle, which, as we know from the Baijnâth inscription as well as from Kalhana himself, corresponded with A D 813, Troyer refers to A D 816, and this error of three years pervades all the dates throughout the first six books of his translation So also Wilson's Chronology of Kashmir is throughout twenty-one years in advance of the true dates How all this happened I cannot even guess, but can only repeat the old saying "*aliquando bonus dormitat Homerus*"

The astronomers have been much puzzled to account for the alleged centennial motion of the Seven Rishis from one Nakshatra to another, which they admit is not visible to the human race Thus the commentator Sridhara Swâmi explains, that "the two stars which rise first are Pulaha and Kratu, and whichever asterism is in a line south from the middle of those stars is that with which the Seven Rishis are united, and they so remain for one hundred years" Other explanations are cited by Colebrooke, who closes his account with the opinion of Kamalâkara, who observes, that "no such motion of the stars is perceptible Remarking, however, that the authority of the *Purânas* and *Sanhitâs*, which affirm their revolution, is uncontrovertible, he reconciles faith and experience by saying, that the stars themselves are fixed, but the Seven Rishis are invisible deities, who perform the stated revolution in the period specified" *

The mythologists, however, give a different explanation According to them the Seven Rishis, having given offence to their teacher in the Satya-Yuga, were cursed by him and condemned to spend the remainder of their lives as antelopes, wandering from one Nakshatra to another every hundred years Hence they were named the *Sapta-Mriga*, or "Seven Antelopes" This name recalls the *Septem Triones* of the Romans Some say that the Rishis were doomed to take the shapes of different animals every hundred years

But however obscure may be the origin of the cycle, there is no doubt about its antiquity, as both Varâha Mihira and Bhattotpala refer to the description of it given by Vriddha Garga, whose date is fixed by Dr Kern to the first century B C By his account the cycle must have been in use before the beginning of the Kâli-Yuga, as he notes that the Seven Rishis had then passed 25 years in the Nakshatra or Lunar asterism of Maghâ Then as Maghâ was the 10th of these asterisms, the beginning of that Chakra or cycle of 2700 years must be dated back by 975 years to B C 4077 But the genealogical lists of the Purânas point to a still earlier period, as they place Krishna in the 52nd generation after Brahmâ Allowing twenty-five years to a generation the Hindu date of the creation would be thrown back by upwards of 1300 years before the Kâli-Yuga, or to B C 4400

On referring to the accounts of ancient India handed down to us by Alexander's companions, I find a curious statement which seems to bear directly on this question of the starting point of Indian chronology

* See Colebrooke's Essays, II, 314 and 316.

The statement is preserved by Pliny, Solinus, and Arrian The first says, "Colliguntur à Libero Patre ad Alexandrum Magnum reges eorum CLIV, annis sex millia CCCCLI adjiciunt et menses tres,"—that is, "they reckon from Bacchus to Alexander the Great 154 kings, who reigned for 6451 years and 3 months" As Alexander entered the Panjâb in 326 B C, and left it towards the end of the same year, this account fixes the starting point of Indian chronology to the year $6451\frac{1}{4} + 326 = 6777$ B C.

Now it is a curious coincidence that if another *Saptârshi Chakra* of 2700 years be added to 4077 B C, or the beginning of the Chakra indicated by Vriddha Garga, the initial year will fall in 6777, the very year which was said by the Indians of Alexander's time to be the initial point of their history This coincidence is certainly very remarkable, and as it is the result of the addition of such a large period as 2700 years, it would seem to point to the conclusion that so early as the time of Alexander the *Saptârshi Chakra* of 2700 years was the common mode of Indian reckoning This indeed has already been inferred from the statement of Vriddha Garga himself

The reckoning of the Lok-Kâl, as now used in Kashmir and the other hill states, is by the common luni-solar years beginning on Chaitra-sudi 1, or the new moon of Chaitra The cycle consists of 27 centuries, each counting from 1 to 100 years, when a new reckoning is begun. The first year of each century corresponds with the 25th year of each Christian century According to Abu Rihân the people of Multân had only recently adopted the Kashmiri reckoning from Chaitra, while in Sindh and Kanauj they still reckoned the year from *Mânkhir* (that is from Mârgasiras or Agrahayana) *

For ascertaining any dates recorded in the Lok-Kâl the corresponding year of the Kâli-Yuga must be obtained from the General Table, and the calculation must be made according to the rules laid down for the luni-solar calendar In the Râja Tarangini the years are always mentioned by their numbers, and so they are in the Baijnâth and Mandi inscriptions But the name of the century, which should be that of the Nakshatra, is never given

In Abu Rihân's account of the centenary cycle, there are several discordant numbers which I find it difficult to reconcile He states that when the Indians wished to note the date of the taking of Somnâth [January 1026 A.D], they set down the figures 242, 606, and 99, which added

* Reinaud, Fragments Arabes et Persans, p 146

together gave 947 of the Saka era [equivalent to A D 1025-26]. He explains the numbers by referring 242 to the number of years which had passed before the Indians began to use the centenary cycle, which came in with the era of the Guptas* In a previous passage, however, he makes this period only 241 years The figure 606 indicates the number of complete centuries (counting 101 years to each century), and the last figure 99 represents the number of years elapsed (éconlees) of the current cycle Now it seems to me that Abu Rihân has not properly understood the number 606, which I would explain as follows The unit 6 seems me to refer to the period which had elapsed between the establishment of the so-called Gupta era in A D 319, and the beginning of the centenary reckoning in A D 325 According to this explanation, the account will stand thus —

A D 78 79, establishment of the Saka era
241 years
319 establishment of the so-called Gupta era.
6 interval
325 beginning of the centenary cycle
600 years elapsed
925
99 years of current cycle elapsed
1024-25 A D

But as the 99th year is said to have elapsed (éconlee), the current year of the cycle would have been 100 and not 99 Accordingly, the year A D would have been 1025-26, which is correct, as the fall of Somnâth took place in January 1026

The following table will be of use in showing at a glance the initial year of each century, as well as its Nakshatra or Lunar asterism according to the different reckonings of Vriddha Garga and the Purânas on one hand, and of Varâha and the later astronomers on the other The numbers placed against the names of the asterisms show the number of each century, while the beginning of the *Chakra*, or complete cycle of 2,700, is indicated by the No 1 placed against Aswini Thus, on the left hand, it will be seen that the cycle of the commonly received account began in the years 6777, 4077, and 1377 B C, and in 1325 A D, while those of Varâha Mihira's reckoning began in 3377 and 677 B C By the former it will be seen that the Seven Rishis were in Maghâ between 3177 and 3077 B C, that is in B C 3101 at the beginning of the Kâli-Yuga, while by the latter, they are placed in Maghâ just 653 years later, between B C 2477 and 2377, that is, in B C 2448

II.—BÂRHASPATYA-MÂNA,

OR

60-YEAR CYCLE OF JUPITER

THE *Bârhaspatya-Mâna*, or Cycle of Jupiter, is a period of sixty years, or five revolutions of the planet, each year of which has a different name This era was considered by Warren to be "very ancient,"* but James Prinsep, misled by Csoma de Koros and Bentley, thought it was a "comparatively recent introduction"† The former understood from the Tibetan authorities that the Vrihaspati Chakra was introduced *into India* about the year 965 A D, a date which tallied very closely with Bentley's assumed epoch of Varâha Mihira in A D 966-67 Happily, Bentley's vagaries have long ago been set to rest, while Colebrooke's date of Varâha Mihira, the author of the Sûrya Siddhânta, has been satisfactorily established As Varâha died in A D 587, his writings describing the Cycles of Jupiter must be referred to the middle of the Sixth Century A D But as he quotes Vriddha Garga as his authority,‡ the Jovian Cycle must have been in use before the Christian era.

There are three different modes of reckoning the cycle of sixty years, of which the oldest is certainly that preserved by Varâha Mihira, as the first year of the Kâli-Yuga, by his account, is the twenty-seventh year of the Jovian Cycle The second is the reckoning of the Jyotishtava, which is clearly only a correction of Varâha Mihira's method, as it makes the first year of the cycle correspond with the first year of the Kâli-Yuga Both of these reckonings have been in use in Northern India, where the necessary omission of every eighty-sixth year of the Jovian Cycle has always been preserved The third method is the reckoning followed in the south of India, by which the Jovian year is considered exactly the same as the solar year, and the

* Warren's Kala Sankâlita, p 199 † Prinsep's Useful Tables, p 27.
‡ Davis in Asiatic Researches, III, p 78

names are taken in succession, without any correction for the difference between the period of one revolution of the sun and that of one-twelfth part of a revolution of Jupiter By this mode of reckoning the actual Cycle of Jupiter is entirely lost sight of, and the sixty names become simply the appellations of as many solar years

The Bârhaspatya-Mâna has been fortunate in finding two such capable expounders as Davis and Warren, to whose works I may refer for a complete exposition of the cycle It will be sufficient here to note the rules for finding the years of the cycle according to the two slightly different modes of the Northern reckoning

The Sûrya Siddhânta rule, as explained, is as follows —Divide the expired years of the Kâli-Yuga by 86, add the quotient to the dividend, divide the sum by 60, and the quotient gives the number of cycles expired Then, if the proposed year should fall less than 31 from the last expunged year of the Chakra, add 28 to the remainder, but if it should be more than 31, add only 27, and the remainder so increased will indicate the current year of the Chakra. Take the year 223 A D = 3324 Kâli-Yuga, as an example

$$-86\,)\,3324\,(38 \quad +3324 = 3362$$
$$-60$$
$$56 + 2 \text{ over}$$
add 28

30th year of 57th cycle

A reference to the general table will show that this result is correct, reckoning from Prabhava

The rule followed in the second method is thus laid down in the Brihat Sanhita *

"Multiply the years expired since the era of the Saka King by 11 and the product by 4, add 8589, divide that sum by 3750 To the quotient add the Saka years, divide the sum by 60 (to find the cycles)

Taking the same year as before A D 223 − 78 = 145 Saka—

	145	4
×	11	+ 145
	1595	149
×	4	− 60 —
	6380	Cycles 2+29 years complete
+	8589	or 30th year current as before.
	14969	4
+	3750	

* Dr Kern's Translation of the Brihat Sanhita, c viii, 20-21.

The Jyotishtava rule is practically the same as that of the Varâha Sanhita, the only real difference being in the amount of the *Kshepa*, or sum added —"Multiply the Saka year by 22, add 4291 to the product, and divide by 1875 Next add the quotient to the Saka year, and divide the sum by 60 The remainder will be the last expired year reckoning from Prabhava."

Taking the same year as before A D 223 − 78 = 145 Saka,

Then 145 Saka	145 Saka
22	4
290	149
290	− 60 —
3190	Cycles 2 + 29 complete years,
4291	or 30th year current as before
+ 1875) 7481 (4	

In these last two methods the multiplying by 11 and then by 4 of the first is equivalent to multiplying by 44, which is exactly double the multiplier 22 of the second, just as the divisor 3750 of the first is double 1875 of the second In other words, $\frac{11 \times 4}{3750} = \frac{22}{1875}$ There is a slight difference in the *Kshepa*, or addition, as the half of 8589 is 4294½, or a little more than 4291 As James Prinsep has remarked, the factor $\frac{22}{1875}$ " is equivalent to dividing by 85 227, the period when a year is to be expunged by this system "

But the same result may be obtained by a further simplification of the process, as follows —To the Saka date add 195, then divide the sum by 85, and add the quotient to the Saka year Then divide by 60 the quotient will give the number of cycles expired, and the remainder the number of expired years of the current cycle Thus taking the same year 145 Saka, the process is

145	145
+ 195	+ 4
85) 340 (4	149
	60 —

Cycles 2 + 29 years expired.

By the Telinga reckoning of Southern India the cycle began twelve years before the Kâli-Yuga, the first year of which corresponds with

Pramatha, the thirteenth year of the cycle The rule for ascertaining the cycle year for any particular date is simply to divide the expired years of the Kali-Yuga by 60, and the quotient will give the number of expired years

Take the same year A.D 223 + 3161 = 3324 Kali-Yuga
— 60 ——
Cycles 55 + 24 years

add 12 for the years before Pramatha, and the result is 36 years of the cycle expired, and the 37th year current as in the general table

As the years of the 60-year Cycle of Jupiter are only occasionally mentioned in the inscriptions of Northern India, I have not thought it worth while to give the Jyotishtava reckoning in addition to that of the Sûrya Siddhânta In fact, the difference between the two is never more than one year, and that only between the two periods of omitted years In the Second Century A D, the omitted year of the Sûrya Siddhânta reckoning took place in 136, while that of the Jyotishtava was two years later—in 138 In A D 394, the omissions took place together In A D 479 the Jyotishtava omitted year preceded that of the Sûrya Siddhânta by one year, but in the present Century the Jyotishtava omitted year, No 48 in 1848, preceded the other, No 1 of 1856, by thirteen years The current years of the two cycles, however, generally correspond, excepting in the short periods between the two omissions, when they differ by only one year The years 847 and 907 A D were initial years of cycles in all three modes of reckoning and the numbers of all the years coincided from A D 825 (the 39th year) down to A D 909

The Telinga computation, though useless as an astronomical cycle is of great value in fixing the dates of inscriptions where the numerical figures are at all doubtful, or where the name of the era may be uncertain Of the latter class there is a very curious example in an inscription translated by Dr Hall * The record is dated "in the *Saka* year twelve hundred and seventy-five, called *Chitrabhânu*, in the light fortnight of *Mârgasirsha*, its fifth day, and Saturday" Now nothing can apparently be clearer than this date, which corresponds with A D 1353, and yet it is absolutely certain that the word 'Saka' cannot be intended for the *Saka* era,† as the name of *Chitrabhânu*, which is the 16th year of the Jovian Cycle, corresponds exactly with 1275 of the

* Bengal Asiatic Society's Journal, XXVIII, pp 4 5

† I have since found an inscription dated in Vikrama Saka.

Vikramâditya era according to the Northern reckoning, while the Saka year 1275 is the 33rd year of the Jovian Cycle in the North, and the 27th year in the South, both many years distant from Chitrabhânu But besides this evidence there is also that of the week day, *Saturday*, which agrees with Mârgasiras-Sudi 5 in the Vikramâditya era, and not in the Saka era, when that date fell on a Monday Another reason for accepting the earlier date is the fact that Mâlwa had already become a province of the Muhammadan empire of Delhi long before Saka 1275, or A D 1353, whereas in Vikrama Samvat 1275, or A D 1218, Mâlwa was still under Hindu rule, as the invasion of Iltutmish did not take place until A.D 1230

A good example of the Southern mode of reckoning is found in the date of the Kardla copper-plates, in 894 Saka in the year *Angiras*, on Wednesday, the full moon of Aswina, during an eclipse of the moon * The year *Angiras* is the 6th of the cycle corresponding with 894 Saka (or A D 972) of the Southern reckoning According to the Northern reckoning the year was Sumukha, or the 7th But, strange to say, the full moon of Aswina was not a Wednesday according to Cowasjee Patell,† who makes the luni-solar year of Saka 894 begin on Tuesday the 19th March 972 A D The full moon of Aswina is the 192nd day of the ordinary year, which number divided by 7 gives 3 over, or Thursday the 26th of September for the day of full moon Now we know that there was an eclipse of the moon on Wednesday the 25th of September A D 972, which actually was the full moon of Aswina according to the Northern reckoning of the Sûrya Siddhânta I have calculated the date by both reckonings, and I find that, by the Southern reckoning, the 1st Vaisâkh of the solar year fell on Friday the 22nd March, and the 1st Chaitra-Sudi of the luni-solar year 4 49 days earlier, or on Monday the 18th March 972 A D , and not on the 19th as given by Cowasjee Patell According to the Northern reckoning the 1st Vaisâkh of the solar year fell on Saturday the 23rd March, and the 1st Chaitra-Sudi of the luni-solar year 4 808, or five days earlier,—that is, on Monday the 18th March By both reckonings, therefore, the full moon of Aswina fell on a Wednesday But the cycle year of Jupiter agrees with the Southern reckoning

The cyclic names, however, sometimes disagree one year with the reckoning of the other eras Thus there are no less than three inscriptions, all dated in the Saka year 730, whilst each has a different year of the Jovian Cycle assigned to it These are Vyâya the 20th year, Sar-

* Royal Asiatic Society's Journal, III, 104 † Patell's Chronology, p 186

vajit the 21st, and Sarvadhâri the 22nd The second name agrees with the date according to the Northern reckoning, and the last according to the Southern account But the first, which occurs in the Nâsik inscription, and should therefore belong to the Southern reckoning, is two years out, and is therefore most probably a mistake

Amongst eighty inscriptions which I have noted as containing year names of the Jovian Cycle, there are only five which conform to the Northern reckoning The latest is a short record on a pillar in the cloisters of the Lâl Darwâza Masjid at Jaunpur,* in which the date is stated to be "the year Plava of Samvat 1353" Both dates correspond with A.D 1296 By the Southern reckoning Plava coincides with Samvat 1358

In the annexed table I have given the Sanskrit names of all the sixty years, with their numbers counting from Prabhava The numbers only are given in the general table for want of space In the inscriptions the names only are given, so that whenever the name of a Jovian year is found in an inscription, it will be necessary, in the first place, to refer to this table for its number

I have also given translations of the Tibetan names which were derived from the Chinese, for all the sixty years They are formed by a combination of the names of the twelve animals of the smaller cycle of twelve years with the five elements The first cycle dates from A D 1027, and not from 1026, as stated by Csoma de Koros, and adopted by Prinsep† At page 181 of his Grammar, Csoma correctly states that "the present year 1834 being the 28th year of the 14th cycle," which gives A D 1807 as the first year, and therefore in taking 1026 as the first year of the first cycle, he is one year in error

Prinsep quotes Csoma's account of a period of 403 years, termed *Me-kha-gya-tsho*, as preceding the introduction of the Kâla-Chakra, or 60-year Cycle of Jupiter in Tibet, and he adopts his opinion that it has reference to the Hijra era "If," says Csoma "we add these 403 years to 622, the first year of the Hijra, we have exactly the year 1025, whence with 1026 commences the first cycle of 60 years of the Tibetans" But the correct date was 1027, and the number 403 most probably had reference to the years passed from the Kashmiri Lok-kâl of A D 625

* See Archæological Survey of India, XI, 126

† Tibetan Grammar, p 195, Prinsep's Useful Tables, p 30, quotes Csoma, Bengal Asiatic Society's Journal, III, 6, but the passage is not there

down to A D 1027, when the Cycle of Jupiter was introduced The name was only a symbolical mode of reckoning the number 403 as *mé*, "fire" = 3, *kha*, "vacuity" = 0, *gya-tsho*, "ocean" = 4, or put together 403 It had therefore nothing to do with "the entrance of the infidels into Makha"

Csoma, in his Chronology, states, that the Baidurya Karpo was "written in the first year of the twelfth cycle, or A D 1687" This is correct, as the unit of each initial year of a cycle should be a 7 So also the period elapsed from the introduction of the Kâla-Chakra down to 1687 is said to be 660 years, which gives A D 1027 as the first year of the first cycle

It is perhaps only accidental that the year 1027 is also the beginning of the 60-year cycle in Southern India But the coincidence is curious. In China the cycle began in 1024 A D, a fact which is proved by the numbers attached to the Tibetan names in the accompanying table, which shows that three years of the Chinese or Tibetan cycle names had already passed when the Indian cycle, commencing with Prabhava, began.

In my work on Ladâkh I have made the same mistake of one year as was done by Csoma himself I stated correctly (p 396) that the year A D 1851 was the 45th year of the 14th cycle, for, deducting 44 from 45 and from 1851, we get the first year = 1807 But in the list of initial years I have given A D 1026 down to 1806, instead of A D 627 to 1807, owing to my faith in Csoma's accuracy.

III.—BÂRHASPATYA-MÂNA,

OR

12-YEAR CYCLE OF JUPITER.

THE smaller Cycle of Jupiter consists of a period of twelve years, or one-fifth of the greater Cycle It was described by Davis at some length, but is only briefly noticed by Warren * I have already given a detailed account of this Cycle in my attempt to fix the initial point of the Gupta era † Varâha Mihira notices it in the following terms "Each year (during which Jupiter completes a twelfth part of his revolution) has to bear the name of the lunar mansion in which he rises The years follow each other in the same order as the lunar months" They are also named after the lunar months with the prefix of the word 'Mahâ' Thus Lalla says

Maghâ-ska Maghâyam yukta Maghâyam-ska Gururgada Mahâ Mâgha

"When both the Moon and Jupiter are in the asterism Maghâ, on the day of full moon of the month Mâgha, then the year is called *Mahâ-Mâgha*"

The statement of Varâha, quoted above, that the year has to bear the name of the *mansion* in which Jupiter rises requires some explanation The twenty-seven Nakshatra, or lunar mansions, are divided into twelve groups, nine of which comprise two mansions only, and the remaining three each three mansions One Nakshatra in each of these twelve groups gives its name to the luni-solar months, and consequently to the years of this cycle

According to the rule for naming the several years of the 12-year Cycle of Jupiter, the year is called after the Nakshatra in which the planet rises heliacally. But in practice the names of the Jovian years

---

* For the former, see Asiatic Researches, III, 217, and for the latter, the Kâla Sankâlita, p 197

† See Archæological Survey of India, Vol X, Appendix

are made to coincide with those of the luni-solar months So that should the planet rise in Bharani the year is not called Bhârani, but Aswini, which is the name-giving Nakshatra of the group to which Bharani belongs

Bhattotpala quotes Garga to the effect that 170 solar years being equal to 175 Jovian years, the two names of Aswayuja and Chaitra must be omitted.

This proportion was afterwards altered by Varâha, who made 172 years of Jupiter equal to $170\frac{6}{11}$ solar years, on which account two of Brihaspati's years are to be omitted in that period His words are

"*Saptatyabda rate ekâdasa bhagaih panchabhir adhike gate Guru yukta Nakshatra mâsa samyuta varsha dvayamâdhikam bhavati*"

Practically, every eighty-sixth name is expunged, and consequently the omissions are confined to six names out of the twelve, or, in other words, the omissions fall only on the alternate names in regular succession Thus the six omitted names are Srâvana, Aswayuja, Mârgasiras, Mâgha, Chaitra, and Jyeshtha The rule for finding the year of the 12-year cycle is only a slight extension of that for the 60-year cycle

Rule—Find the equivalent year of the Saka era, and multiply it by 22, then add 4291 to the product, and divide by 1875 Add the quotient without fractions to the Saka date, and divide the sum by 60 This quotient gives the number of expired cycles, and the remainder the number of expired years of the current cycle counting from Prabhava. To find the year of the 12-year cycle divide the last remainder by 12, the quotient will give the number of Jupiter's own revolutions completed, and the remainder will be the number of years expired of the current 12-year cycle, counting from Mahâ-Srâvana as the first The following example will show the working of the rules Take A. D. 166 = 88 Saka

I

88 × 22 = 1936
+ 4291
—
— 1875) 6227 (3
88
—
91
+ 60 —
Cycle 1 + 31 years.

II

31
12—

Cycles 2+7 years completed, or the 8th year current, which counted from Srâvana gives Jyeshtha, as in the General Table.

But the same result may be obtained by the shorter process which I have proposed in my account of the 60-year cycle. Thus, to the Saka date add 195, then divide the sum by 85, and add the quotient to the Saka Then divide by 60, the quotient will give the number of cycles expired, and the remainder the number of expired years of the current cycle The above example will therefore be as follows —

Saka 88
+ 195
—
— 85) 283 (3 + 88 = 91
— 60 —
1-31 as before

Very few inscriptions have hitherto been discovered dated in the 12-year Cycle of Jupiter But four of these, which are found coupled with the concurrent dates of the Gupta era, are of unusual importance from the aid which they may give in fixing the initial point of the Gupta era, which will be discussed hereafter These four dates are found on the copperplate inscriptions of Raja Hastin and his son Sankshoba. They are as follows —

Year 156 of Gupta = Mahâ Vaisâkha
„ 163 [read 173] = Mahâ Aswayuja
„ 191 = Mahâ Chaitra
„ 209 = Mahâ Aswayuja

Another inscription of the same family on a stone pillar gives the name of Mahâ Mâgha, but without any concurrent date

Mr Fleet has published* two ancient inscriptions of the Kadamba Râjas of Banawâsi in the Dakhin, which are apparently dated in this 12-year cycle of Jupiter Both inscriptions are of Raja Mrigesa, the earlier one being dated in the *year Pausha*, which is said to be the third year of his reign, and the later one in the year *Vaisâkha*, which is said to be the eighth year of his reign From these two statements we learn that the third year of his reign must have begun in Mahâ Mârgasiras, as shown by the succession of the names of the years as follows —

Mahâ Mârgasiras	Mahâ Pausha	Maha Mâgha	Mahâ Phâlguna	Mahâ Chaitra	Mahâ Vaisâkha
3rd year	4th year	5th year	6th year	7th year	8th year

* Archæological Survey of India, Vol X, 126-27

Here unfortunately there is nothing to fix the date beyond the fact that between the years named Mahâ Pausha and Mahâ Vaisâkha there was no name omitted But I think that something may perhaps be gained from the inscriptions to assist in finding an approximate date

Sir Arthur Phayre has published a Burmese inscription from Pugân, which appears to me to be dated in the 12-year Cycle of Jupiter, as well as in the common era in use in Burma It opens with the date thus "In the era 551, the *Tharawan* year" Tharawan is the Burmese pronunciation of *Srâvana* But the year 551, or A D 1189, was Mahâ Jyeshtha If we might read 553, or A D 1191, then the year would correspond with the Indian year of Mahâ Srâvana

I have quoted these examples from Banawâsi in the Dakhin, and Pugân in Burma, to show how widely spread was the use of the Cycles of Jupiter in ancient times

The people of Tibet and Ladâk also make use of a cycle of twelve years for the computation of short periods, such as a person's age, or the date of any recent event In this cycle each year is named after a different animal, as follows —

	Tibetan			*Tibetan*	
1	Byi-lo .	Mouse-year	7	Ta lo	Horse-year
2	Lang-lo	Ox ,,	8	Lug-lo	Sheep ,,
3	Stag-lo .	Tiger ,,	9	Spre-lo	Ape ,,
4	Zos-lo . .	Hare ,,	10	'Bya-lo .	Bird ,,
5	Brug-lo ..	Dragon ,,	11	Khyi-lo	Dog ,,
6.	Brul-lo ..	Serpent ,,	12	Phog-lo	Hog ,,

The only difficulty that I see about accepting the 12-year Jovian Cycle of Varâha for the five centuries which preceded him is the statement of Garga about the omission of Chaitra and Aswayuja as if in his time they were the only years subject to retrenchment But as Garga mentions that 172 of Jupiter's years were equal to 170 solar years, while Varâha makes them equal to $170\frac{5}{17}$ solar years, the two cycles are practically the same in other respects It does not, however, follow that no other years were subject to omission because Chaitra and Aswayuja alone are mentioned My impression is, that the same six months that are omitted by Varâha's rule were also subject to omission in Garga's time But even admitting that Chaitra and Aswayuja were the only two years that were expunged from the time of Garga down to Varâha Mihira, I see no difficulty in adjusting the times of omission so as to make them the only expunged years As Chaitra and Aswayuja are also omitted years

in Varâha's scheme, they will of course remain constant, as the average period of omission is in both cases the 86th year If then we accept the year 310 A D in which Chaitra was omitted as common to both systems, we have only to take the Aswayujas and Chaitras which fall *nearest* to the 85-year periods, either those preceding (A) or those following them (B), and the result will be the same excepting only as regards the names of the other omitted years This will be seen at once by the following arrangement of the names —

Varâha Mihira.			*Proposed Arrangements*					
A D	Interval		A D	Interval	A	A D	Interval	B
310		Chaitra	310		Chaitra	310		Chaitra
	85			77			89	
395		Jyeshta	387		Aswayuja	399		Aswayuja
	85			89			89	
480		Srâvana	476		Chaitra	488		Chaitra
	85			89			77	
565		Aswayuja	565		Aswayuja	565		Aswayuja
	85			77			89	
650		Agrahayana	642		Chaitra	654		Chaitra
	85			89			89	
735		Mâgha	731		Aswayuja	743		Aswayuja
	85			89			77	
820		Chaitra	820		Chaitra	820		Chaitra
	510	years		510	years		510	years
÷ 6			÷ 6			÷ 6		
Mean	85	interval	Mean	85	interval	Mean	85	interval

From this table it will be seen that a regular succession of Chaitras and Aswayujas might be omitted while still retaining a uniform mean period of eighty-five years It will also be seen that at every third period the *names* of the omitted years, as well as the dates of omission, agree with those of Varâha Mihira

IV —KÂLI-YUGA

THE Kâli-Yuga, or fourth age of Hindu Chronology, dates from the year 3102 B C , the year 1, expired or completed, being B C 3101 The Four Yugas, or ages, which comprise one Mahâ-Yuga, consist of the following periods —

	Years			
Krita-Yuga ..	1 728,000	— 360 =	4800	years of Gods.
Treta Yuga .	1 296,000	— 360 =	3600	,,
Dwâpara-Yuga .	864,000	— 360 =	2400	,,
Kâli Yuga ..	432,000	— 360 =	1200	,
One Mahâ-Yuga	4 320,000	— 360 =	12000	years of Gods

Regarding the origin of the Mahâ-Yuga I have already expressed my opinion that it was the invention of the astronomers founded on the precession of the equinoxes It may be objected that the division into four Yugas and their duration are mentioned both in the Code of Manu* and in the Mahâbhârata But what is the age of Manu's Code? The references to female heretics who wear an unlawful dress or a dress unauthorized by the Vedas [v, 89, 90], of "female anchorets, or nuns [viii, 36, 37], and of "heretical books," or books of a false religion [ii, 11, and xi, 66], point so clearly to Buddhism that the Code in its present form must certainly be posterior to the spread of Buddhism under Asoka.

The era of the *Kâli-Yuga* was in use down to the time of Varâha Mihira, who first introduced the use of the Saka era into Astronomical works Aryabhata, who was not more than fifty years prior to him, still computed by the era of the Kâli-Yuga† The initial point of the era seems to have been a traditional date of the period of the great war, which had been handed down perhaps for ages This date of 3102 B C

* Mânava Sanhita, or Mânava Dharma Sastra, I, 67 *et seq*

† Weber's History of Indian Literature, p 260

as the year 0 of the Kâli-Yuga was accepted by all, and from it the calculations of Aryabhata, and Varâha Mihira for the solar and luni-solar periods were computed

Where the Kâli-Yuga era is used alone, the day of the month may be expressed either according to the solar calendar, or to the luni-solar one Frequently the year is given in two different eras, one of which may be usually connected with the solar calendar and the other with the lunar In the North of India the Kâli-Yuga and the Saka years are generally, but not always, connected with the solar reckoning, while in the South of India the Saka era is usually accompanied with the luni-solar reckoning The Samvat of Vikramâditya is the only era that is exclusively luni-solar

V —CYCLE OF PARASURÂMA

THE era of Parasurâma is a cycle of 1000 years, which is said to have begun in B C 1175¾ complete, or 1176 B C current It has been described by Warren in his Kâla Sankâlita,* where he states that its use is confined to the Southern part of the Peninsula, called Malayâlam, comprising Malabâr and Travancore down to Cape Comorin "The commencement of the year 977 of the 3rd cycle is said to have coincided with the 1st of (the solar month) Aswina of 1723 Saka, and the 14th September A D 1800" Here the Christian year is wrong, as it should be 1801, to agree with Saka 1723 According to Cowasjee Patell, the initial day of the year 977 was the 15th September 1801 The year is a solar one This cycle is also called the Quilon or Kollam era Dr Burgess calls it the Kollam Andu era, and says that the last expired cycle began on the 25th August, A D 825 † Cowasjee Patell gives the 29th August of the same year The initial dates of the different cycle are therefore

I	Cycle	B C	1176
II	„	„	176
III	„	A D	825
IV	„	„	1825

It is never used in Upper India, and indeed is scarcely known, except by name, even to the astronomers

* Kala Sankalita by Colonel Warren, p 298.

† *Indian Antiquary*, 1882, p 271

VI.—NIRVÂNA OF BUDDHA.

THE *Nirvâna*, or death of the last Buddha Sâkya Muni, has been in use from a very early date down to the present day According to the Buddhist Chronicles of Ceylon and Burma, the Nirvâna took place in 544 B C But as the inauguration of Asoka is referred to the year 218 after the Nirvâna, it seems probable that there must be an error in the date of the Nirvâna itself to the extent of sixty-six years, as the chronology of the reign of Asoka is now pretty well ascertained His father's death took place in the year 214 of the Nirvâna, or B C 264, and his inauguration as king four years later, after he had prevailed over his brothers.

Only two inscriptions have yet been found which are dated in this era. The first is contained in the rock edicts of Asoka at Rupnâth and Sahsarâm The second occurs in an inscribed slab which I found in the Temple of Surya in the city of Gaya The date of Asoka's inscription is the year 256, or the 42nd year after the death of his father, his own reign being stated in the chronicles at 4 years + 37 years, or altogether 41 years complete, and 42 current The second date is 1813 of the *Bhagavat Parinirvritte Samvat*, or Nirvâna, or Thursday the 1st of Kârtika-badi

In Northern India the true date of the Nirvâna was lost at a very early period Thus, in the time of Hwen Thsang, A D 630—645, the Buddhist schools held widely different opinions, varying from 900 and 1000 years up to 1200, 1300 and even 1500 years prior to that date,* which would place the Nirvâna of Buddha either in 250, or 350 or 550 or 650 and 850 B C The same extravagant antiquity was also asserted in the time of FaHian, who places the Nirvâna during the reign of Ping-Wang, Emperor of China in B C 770—719† A similar antiquity was still claimed as late as the Twelfth Century A D, during the reign of Asoka

* Julien's Hwen Thsang, II, 335

† Record of Buddhistic Kingdoms, translated by Giles, C vii

Balla Deva Two of his inscriptions are dated in the years 51 and 74 of the Lakshmana Sena era, or in A D 1157 *and* 1180 A third inscription, which is dated in the year 1813 of the *Parinirvritte* of *Bhagavata*, shows that the time the Nirvâna was believed to have occurred, was about 656 to 633 B C.

But these extravagant periods are disproved by Brahmanical as well as by Buddhist records, after making the necessary correction for the dates of Chandra Gupta and Asoka

The following is the account given in the Brahmanical Purânas —

VAYU PURANA			MATSYA PURANA		
Ajâta Satru, 25—8	= 17	years	Ajâta Satru, 27 – 8 =	19	years
Harshaka	25	,,	Vansaka	24	,,
Udayâswa	33	,,	Udasin	33	,,
Nandi Vardhana	42	,,	Nandi Vardhana	40	,,
Mahanandi	43	,,	Mahanandi	43	,,
	160	,,		159	,,
Mahapadma + 9 Nandas	100	,,	Mahapadma + 9 Nandas	100	,,
Chandra Gupta	24	,,	Chandra Gupta	24	,,
Bindusâra	28	,,	Bindusâra	94	,,
Accession of Asoka	312	years		or 311	years

after the *Nirvâna* of Buddha

Now the period stated in all the Buddhist records is 214 years, the difference of nearly 100 years, being in the reigns between Ajâta Satru and Chandra Gupta In favour of the Buddhist records I may remark that Buddhaghosha, "the Brahman youth, born in the neighbourhood of the terrace of the Great Bo-tree, . who had achieved the knowledge of the three Vedas,"* must have been cognizant of the northern chronology when he translated the Singhalese *Attha-katha*, in which he has adopted the same dates as are found in the Mahawansa and Dipawansa Admitting the correctness of this suggestion, it follows that Buddhaghosha either gave a preference to the Singhalese chronology, or that it did not differ from the northern chronology in his time, that is in A D 400. But whatever may be the true explanation of the difference, the fact remains that the Buddhists are unanimous in placing the Nirvâna of Buddha 214 years prior to the accession of Asoka Accepting this as the most probable account of the interval, we obtain for the Nirvâna the corrected date of 264 + 214 = 478 B C, instead of 544 B C, being a difference of 66 years

* Mahawansa.

A novel theory has lately been put forward to account for the discrepancy by referring the Nirvâna to the time of Buddha's attainment of Buddhahood under the sacred tree As this took place when he was 29 + 6 = 35 years old, the difference is only 80 — 35 = 45 years, instead of 66 years Mr Carter, who proposes this explanation, appears to think that Sâkya obtained Buddhahood at 29 years of age But he only left his home at that age, and had to sit for six years under the Bodhi tree at Uruvilwa before he attained Buddhahood * The Buddhavansa (which he quotes) states vaguely that Gotama did not live to 100 years

Mr Carter's figures are—

Gotama's birth .	572 B C
Nirvâna at 29th year =	543 ,,
Death according to the Inscriptions	483 ,,

I must say that I remain quite unconvinced The period that requires correction is not that between Buddha and Asoka, but the still later period of the impossible reigns of Mutasiwo and his sons for 162 years, or exactly 81 years to one generation If the Buddhist dates of Chandra Gupta and Asoka can be corrected to the extent of 66 years, the date of Buddha's Nirvâna must be subject to the same correction, as the period between them does not seem to be capable of extension On the contrary, the Northern Buddhists seem to have usually curtailed it to 100 years as stated by Hwen Thsang, as well as in the Asoka Avadâna † A single northern work, the Avadâna Sataka, extends the period between the Nirvâna and Asoka to 200 years

For these reasons I retain the year 544 B C as the accepted date of Buddha's Nirvâna, according to the Buddhist chronology of Ceylon and Burma At the same time I think that there must certainly be an error in this date to the extent of about 66 years as shown by the subsequent dates of Chandra Gupta and Asoka.

VII.—NIRVÂNA OF MAHÂVIRA.

THE Jains make use of an era dating from the *Nirvâna*, or death of their last teacher Mahâvira. According to the Swetâmbara sect this event took place 470 years before Vikrama, or in B. C. 527. The Digambaras, however, make it 605 years before Vikrama. As the difference between the two dates is exactly 135 years, it seems probable that the Digambara date of 605 years before Vikrama should be altered to 605 years before Sâka, which would agree with that of the other sect. I have made many enquiries on this subject from learned Jains in Northern India, and the answer has been uniformly the same, '470 years before Vikramâditya.' This also is the date given by the Jains of Gujarât.* The same date is used throughout the Therâvali of Merutunga, who says: "Before the commencement of the reign of Vikrama, Sri Vera's Nirvâna took place 470 years."† Colonel Miles also, in his account of the Jainas of Gujarât and Mârwâr uses the same date.‡ Colonel Tod makes the era 477 years before Vikrama.

VIII.—ERA OF THE SELEUKIDÆ.

THE initial point of the Seleukidan era has been fixed by Fynes Clinton to the 1st of October 312 B C, in the beginning of Olympiad XVII, 1 * According to Ulugh Beg this era began 12 years after the death of Alexander, and 340,700 days before the Hijra of Muhammad, 16th July A D 622 Now 311 complete years B C plus 621 complete years A D = 932 Julian years, contain 340,414 days, which deducted from 340,700 leave 286 days to be accounted for As the Hijra era dates from 16th July there are 196 days in A D 622, which leave only 90 days prior to the beginning of B C 311, so that, according to Ulugh Beg, the Seleukidan era must have begun on the 3rd of October B C 312 The other datum of 12 years after the death of Alexander does not refer to the actual date of Alexander's death, but to the initial day of the 425th year of Nabonasar, 12th November 324 B C, in which year Alexander died Twelve years later places the beginning of the Seleukidan era near the end of the year 312 B C

This era dates from the defeat of Nikanor, the general of Antigonus, by Seleukus, who thus became master of Babylon in Olympiad XVII, I The initial date of the era in B C 312 is also established by the dates on several coins, of which one of Hadrian bears the date HKY, and another of Caracalla bears the date of HKΦ As Hadrian began to reign on the 11th August 117 A D, and Caracalla on the 8th April 217 A D, the first year of the era referred to must have included the dates of 8th April and 11th of August 311 B C †

The names of the months were the same as those of the Macedonian Calendar But as the Seleukidan year began in October, the first month must have been Hyperberetæus The order of the Macedonian months has been gathered by Clinton from Josephus and Suidas

---

* Fasti Hellenici, III, p 311

† Ordo Seculorum, by Henry Browne, pp 487 and 488 See also Fasti Hellenici, III p. 373.

who compare them with the Hebrew and Roman months * Clinton gives an extract from Cardinal Norisius, who quotes Hieronymus to show that in Antioch and other Syrian cities the year began with Hyperberetæus — "In quarto mense qui apud nos vocatur Januarius, apud Orientales enim populos, October erat primus mensis, et Januarius quartus Est (Shebat) in acerrimo hyemis, qui ab Ægyptiis Mechir, à Macedonibus Περιτιος, à Romanis Februarius appellatur" So also Corsini and Scaliger make Hyperberetæus the first month The following are the names of the months with the corresponding months of the Jewish Calendar as found in Josephus and other authors—

	MACEDONIAN	HEBREW	ENGLISH
1	Hyperberetæus	Tisri	October
2	Dius ..	Marcheswan .	November
3	Apellæus ..	Kisleu	December
4	Audynæus	Tebeth ..	January
5	Peritius .	Shebat	February
6	Dystrus	Adar	March
7	Xanthikus .	Nisan	April
8	Artemisius	Ijar	May
9	Dæsius	Swan	June
10	Panemus ...	Thamuz .	July
11	Lous	Ab	August
12	Gorpiæus	Elul	September

Now the Macedonian Calendar, like that of the Athenians, was a luni-solar cycle of 19 solar years, or 235 lunar months, and as more than a century had elapsed from the time of Meton when Seleukus established his era, there can be no reasonable doubt that the Metonic cycle was adopted in Syria This is proved by the following facts †

1 "Whenever Macedonian months are compared with Attic or lunar months, it nowhere appears that they differ in their dimensions or contents

2 "Seleukus Nikator, the founder of the kingdom of the Seleukidæ, gave order to affix the Macedonian names to the Syrian months, which were unquestionably lunar

* Clinton, Fasti Hellenici, III, p 353

† These proofs are taken from Browne's Ordo Sæclorum, p. 461

3 "Ptolemy, in his Almagest, gives the dates of various eclipses and occultations observed at Babylon between the years B C 721 and 229 The last three dates, B C 245, 237, 229, bear the names of Macedonian months, and by calculation prove that the Babylonians under the Seleukidæ measured time by lunar months with Macedonian names

4 "The date on the Rosetta stone, IX Ptolemy Epiphanes, 18th Mechir = 4th of Macedonian Xanthikus, being reduced, proves the same thing"

These facts show most decisively that the Syro-Macedonian calendar of the Seleukidæ was luni-solar, and not solar, as is frequently stated * Thus James Prinsep, copying an article from the Companion to the Almanac for 1830, says —"Their year was solar, and consisted of 365 days, with the addition of a day every fourth year." But the calendar of 365¼ days is the Julian calendar, which was not adopted in Syria until some time after the Christian era, when it had become a Roman province

As the Syro-Macedonian months were lunar, there must have been seven intercalary months inserted at certain periods in each cycle of 19 years According to the Greek cycle of Meton, these insertions took place in the 3rd, 5th, 8th, 11th, 13th, 16th, 19th years of the cycle "The name of the old Macedonian intercalary month is inferred from 2 Maccabees, XI, 21, where the date of a manifesto issued by Lysias, General of Antiochus Eupator, is given as 24th Δυοστορινθιου, but in the Vulgate 24 *Dioscori*, and from the Etymol^m Mag^m we learn, that Διόστορος was the name of a month A missive of Antiochus, evidently written not much later, is dated 15th Xanthikos Hence it is inferred that the place of this intercalary month Διόστορος was the same as that of the Jewish month, *i e*, before Nisan"†

The introduction of the Julian reckoning must have been confined to Syria and the western provinces of the Seleukidan empire, which had been annexed to Rome But in the Eastern provinces, which then formed the Parthian empire, the luni-solar reckoning still maintained its place This is proved most conclusively by the following facts It was the custom of the later Parthian kings to date all their large silver coins with the month and year of their issue The names of all the twelve Macedonian months have thus been found on the coins of the Parthian

* Cowasjee Patell, p 26, of course copies Prinsep. † Ordo Sæclorum, p 461

kings There are a few slight differences, such as Xandikus for Xanthikus, and Solotûs for Lous But on one coin of Vologeses III, I find the name of EMBOAI, which can only be that of the intercalary or *emboliśmic* month * This is accompanied with the date OY or 400, or A D 178-9, in which year there was an intercalary month according to my table It is clear, therefore, that, up to this late period, the people of the Parthian empire still continued to use the luni-solar reckoning of the Macedonian Calendar

I have been thus particular in describing the Syro-Macedonian Calendar of the Seleukidæ as we know that it was in use in the north-west of India, during the period of Indo-Scythian rule, from which we may infer, with some certainty, that it must have been the common reckoning of their predecessors, the Bactrian Greeks Mr Thomas has already shown that this is highly probable, but nothing has yet been found to determine it absolutely

In the Indo-Scythian inscriptions, the names of four different Macedonian months have been found,—namely, Panemos, Daisios, Apellaios, and Artemisios The occurrence of these names shows incontestably that the Macedonian Calendar must have been introduced into Kabul and North-Western India by the Bactrian Greeks, and as the province to the west of the Indus had belonged to Seleukus I conclude that the era of the Seleukidæ must have been adopted there also Unfortunately, the year dates hitherto discovered are all small numbers, which might refer to some recently established era of the Indo-Scythians, or, as suggested by Mr Thomas, they may possibly refer to the Seleukidan era by leaving out the hundreds, which was the common Indian mode of reckoning the year of the Saptârshi-kâl With the Indo-Scythian inscriptions, for instance, the dates of 9, 11 8 and 28 of Kanishka, and of 33, 39, 47, and 51 of Huvishka might either be referred to a new era, such as the Saka-kâl of 78 A D, or to the years 9, 11, 18, &c, of the fifth Seleukidan century, by leaving out 400 In the former case, the year 9 of Kanishka would be 78 + 9 = 87 A D, while in the latter case it would be referred to the year 409 of the Seleukidan era, equal to A D 97-98

It is doubtful, except in a few instances, whether any coins of the Greek kings are dated The three letters PMI on the exergue of the coin of Platon can only be explained as a date, although the usual order of IMP is reversed As a date they represent 147 which can only be

* This coin is engraved in Longperier's unpublished book on the Parthian coinage, Plate XIV, Fig 9

referred to the Seleukidan era, and would, therefore, be equivalent to B C 165-164 The letters OΓ, or 73, are found on a coin of Eukratides, and the letters ΠΙ, or 83, on several coins of Heliokles That these are most probably dates has been proved by Mr Thomas, by a reference to a coin of Heliokles in the British Museum, bearing the full date ΡΠΓ, or 183 * I have since acquired a tetradrachm of Eukratides with the detached letters ΝΑ, which may also be read as a date, or 51 = 151 of the Seleukidan era According to these dates we have—

	Au Sel	B C.
Platon in	147	= 165-164
Eukratides in	51 or 151	= 161-160
Ditto . .	73 or 173	= 139-138
Heliokles	183	= 129-128

After this the dates on the Greek coins would seem to be, as Mr Thomas suggests, only regnal years of the different kings

Having accepted these dates—and I do not see how they can be disputed—I feel that the dates found in the Indo-Scythian inscriptions along with the names of the Macedonian months must also be referred to the Seleukidan era I am quite prepared, therefore, to accept all the dates of the Indo-Scythian inscriptions from Kabul and Taxila and Mathura as belonging to the Selenkidan era, with the hundreds omitted after the Indian custom This also would appear to be Mr Thomas's conclusion, when he says "The question thus arises whether this latter practice (of using the Macedonian names of the months) does not imply a continued use of the Seleukidan era, in association with which the names must first have reached India'

Under this view, the following will be the dates of the Indo-Scythian Princes Kanishka, Huvishka, and Vâsu Deva

A D 80 *Kanishka*, S 9 = 409 − 312 = 97 A D
S 28 = 428 − 312 = 116 —
A D 120 *Huvishka*, S 33 = 433 − 312 = 121 A D
S 51 = 451 − 312 = 139 —
A D 150 *Vâsu Deva*, S 87 = 487 − 312 = 175 A D
S 98 = 498 − 312 = 186 A D
A D 190, close of *Indo-Scythian rule in Northern India*

The accuracy of these dates is confirmed by the discovery of gold coins of Wema Kadphises Kanishka and Huvishka in the Ahin posh Stûpa, along with some Roman gold coins of Domitian, Trajan, and

* Bactrian Coins and Indian Dates, in Royal Asiatic Society's Journal, New Series, Vol. IX, p 3

Sabina, the wife of Hadrian Sabina died in A.D 137, and as there was only one coin of Huvishka amongst twenty-one specimens, the Stûpa was probably built not later than 130 A D

Under these circumstances it appears to me that some account of the era of the Seleukidæ is absolutely necessary for any work treating of early Indian dates I have therefore drawn up the accompanying tables of the initial days of all the years of the era from its commencement down to the close of the Parthian empire in the early part of the Third Century A D I have studied the accounts given by Clinton in his Fasti Hellenici, and by Browne in his Ordo Sæclorum, and I have examined most of their authorities in the original I have also computed many of the test calculations for myself, some of which will be noticed presently

The old Greek year consisted originally of 360 days, divided into 12 months of 30 days each But as many of the Greek festivals depended on the moon, it was soon discovered that the true length of a mean lunation was about 29½ days, and that of a solar year about 365 days Various methods were adopted from time to time for accommodating the computation by lunar months to the solar year In the time of Perikles the *enneateris*, or cycle of 8 solar years, was in use This consisted of 8 lunar years of 354 days each, with the addition of 3 intercalary months, in the 3rd, 5th, and 8th years, making a total of 99 lunations or lunar months But as 8 solar years of 365¼ days contain 2922 days, while 99 lunations of 29½ days amount to only 2920½ days, there was a deficiency of one day and-a half in every cycle of 8 years

To remedy this defect Meton proposed in B C 432 his famous cycle of 19 solar years of 365¼ days each, which differs by only a small fraction from 235 lunations Meton's value of the 19 solar years as 6940 days was a little in excess of the truth, as a year of 365¼ days gives only 6939 75 days in 19 years As this excess of ¼ day amounted to a whole day in 76 years, Kallippus in B C 330, introduced the cycle of 76 years, or four Metonic periods, from which he retrenched the extra day But beyond this, according to Clinton, "he appears to have made no change in the ἐννεα-καὶ-ἑκαετηρὶς of Meton" It is supposed, from the account of Timocharis of the 36th and 47th years being *anni communes*, that he closed the 6th Metonic cycle at its 8th year, or B C 330, which, accordingly, became an *annus communis* as the 1st of the Kallippic cycle of 76 years, which could not have happened if the original Metonic cycle had not been interrupted But Clinton quotes a marble which renders this arrangement doubtful It is quite certain that it could not have been adopted in Syria, as we know that the year 148 of the Seleukidan

era, or BC 165-64, was intercalary,* which is true of the Metonic cycle, but disagrees with that of Kallippus As the Parthian coin of Vologases III shows the same accordance with the Metonic reckoning, there can be no doubt that the Kallippic correction had not been introduced into either Syria or Parthia Clinton also deduces from "the three years described by Ptolemy as 67, 75, and 82 of the Chaldæans, commencing respectively October 15, October 16, and October 1, that the Macedonians must have received the cycle in the 9th year of a Metonic *εννεα-και-δεκαετηρις*, which would be the second of a Kallippic For this reason I have adopted the Metonic cycle in the accompanying tables, which show the initial day of every year down to the close of the Parthian empire I have numbered the Metonic cycles I, II, III, IV, &c, and should it be required to convert any date into the Kallippic reckoning, it is only necessary to throw back every date in each period of 76 years by one day, or, as the Kallippic correction was established in BC 330, to antedate by one day every initial day in the Metonic Cycles IV, V, VI VII, by two days those of Cycles VIII, IX, X, XI, by three days those of Cycles XII, XIII, XIV XV, and so on, deducting one more day for every four Metonic cycles

In the old cycle of 8 years the lunar months consisted nominally of 30 days each one day being "omitted between the 20th and 30th of every alternate month But in those months from which a day was deducted, the last day was still called *τριακας*, and the day omitted was perhaps the 29th, or any other day but the 30th † Meton also retained the nominal value of the month at 30 days but he proposed a new scheme for the days to be omitted As 235 lunations at 30 days each amounted to 7050 days or 110 days in excess of the 6940 days assigned to 19 solar years, he devised the cumbrous and inconvenient plan of omitting every 63rd day throughout the cycle but it is not known whether he included or excluded the seven intercalary months These omitted days or *ημεραι, ἐξαιρετοι*, are shown in the table, which is altered from Clinton's Attic tables to suit the Macedonian Calendar

The seven intercalary months of the Metonic cycle were added at the end of the 3rd, 5th, 8th 11th, 13th, 16th, and 19th years But in the Macedonian Calendar the embolismic month was placed in the middle of the year immediately preceding Xanthikos‡ Clinton supposes that the embolismic months were also subject to the retrenchment of the 63rd

* See 2 Maccabees, XI p 21 † Clinton, Fasti Hellenici, I, p 336

‡ Clinton, III, 353, quoting Macrobius, who states that the intercalations were placed at the end of February of Greeks as well as Romans

day, should it happen to fall upon them But this cannot have been the case, otherwise the number of omitted days would have amounted to 111 9, or nearly 2 in excess of the required number of 110 Meton's scheme consisted of a cycle of 19 years, each of 12 months of 30 days, with seven intercalary months also of 30 days, making altogether 7050 days, from which 110 days were to be deducted to obtain the required number of 6940 days, by omitting every 63rd day Now if the embolismic months had been subject to curtailment, the number of omitted days would have been 112 But if they were not subject to these *omissions*, the required number of 6940 days would have been obtained by passing them over, and striking out the day from the following month This arrangement is shown in Table VII, where the embolismic month of 30 days is placed in the middle of the year between Dustros and Xanthikus

But there is another grave objection to Clinton's scheme, namely, that it would make all the last four months of the cycle full months of 30 days, and as the first two months of each cycle were necessarily full months, there would have been no less than six consecutive full months all lumped together I look upon this result as quite fatal to his scheme

Now, the arrangement which I propose, as shown in Table VII, is quite free from this defect as it has not even a single instance of three full months coming together and only one of three hollow or short months—namely in the last year of one cycle and first two years of the succeeding one According to Clinton's scheme if a new moon had fallen in the first day of the first of the six consecutive full months a new moon would have occurred three whole days before the beginning of the seventh month By my arrangement, the new moon would only differ one day and-a-half from the *σύμπτωσις*

To test the tables, I will take the date of the battle of Arbela, which took place on the twelfth day after an eclipse of the moon, the two armies having been drawn up facing each other on the eleventh night after the eclipse Now the day of battle has been fixed to the 2nd of October B C 331 by the mention of this eclipse The eclipse took place on the night of 20th of September at full moon, and the new moon, which opened the next Macedonian year, must, therefore have fallen on the 5th of October According to my table, the new year's day fell on the 4th October We know that the battle took place very near the end of the Macedonian month, as Arristander had foretold that "a battle would be fought in that very month"* The 2nd of October was the 29th of Gorpiæus, or the last day but one of the month

* Arrian, Hist, Alexandri, III, 7

IX.—ERA OF PARTHIA.

THE notice of a Parthian era was discovered* by George Smith amongst the cuneiform records at Babylon. Three Parthian tablets were obtained at Babylon itself, but only one of them was perfect This gave a double date as follows —

"Month ——— 23rd day, 144th year, which is called the 208th year, Arsakes, king of kings"

George Smith gives the year 248 B C as the first year of the Parthian era But as the first year of the Seleukidan era did not begin until October 312 B C or 311½, only three months of the year 248 at the very utmost can be assigned to the first year of the Parthian era But if, as is quite possible, the Parthian era did not begin until about the middle of the Seleukidan year, its initial point would have been in April 247 B C, or even later, instead of in October 248, and it would not have ended until April 246 or later Now Antiochus II Theos died in January 246,† and as Strabo, Appian, and Suidas, all agree in assigning the revolt of the Parthians to the period immediately following the death of Antiochus II, I think there is a very strong reason for adopting some middle month of the year 247 B C as the initial point of the Parthian era I had already adopted the year 246 for the rise of Bactrian independence, on the testimony of the authors above quoted, in my account of the Coins of Alexander's successors in the East‡ And as I have shown that the date of the death of Antiochus may easily have fallen within the first year of the Parthian era as now established by the cuneiform inscriptions, I think that the year 247 has a better claim to be considered the starting point of Parthian independence than the previous year 248

X.—VIKRAMADITYA SAMVAT.

— ∞ —

THE Vikramâditya Samvat, or era of Vikramâditya, is reckoned from the vernal equinox of the year 57 B C, and the completion of the Kâli-Yuga year 3044 It is used all over Northern India, except in Bengal, where the Saka era has been generally adopted It is used also in Telingâna and Gujarât, but in the latter province the year does not begin until seven months later than in the north, or with the 1st of Kârtik-Sudi, which now falls during October, but which, at the beginning of the Christian era, fell between the middle of September and the middle of October

This era is said to have been established by Vikramâditya, a king of Ujain, to commemorate his victory over the Sakas The earliest date yet found in any inscription, with the name of Vikramâditya attached to it, is one of Raja Jâika, whose name is already well known from the Morbi inscription bearing the date of 585 of the Gupta era In this new inscription the date, as read by Pandit Bhagwân Lâl, is thus expressed

"In the Vikrama Samvatsara 94, in addition to 700, on the 30th day (*amâvâsyâ*) of the dark half of the month of Kârtika, Sunday, in the afternoon (?) on the occasion of a solar eclipse"

The text of this inscription has now been published by Dr Buhler who gives the following translation of the date *

"When seven hundred years of Vikrama exceeded by ninety-four (in figures) 794 (*had passed*) in the second half of the month Kârtika, at the new moon, on a Sunday, under the constellation Jyeshthâ, on the occasion of an eclipse of the sun"

---

* Reinaud Fragments Drabes et Persans, pp 145 146

Now the last day of Kârtika in the Vikrama Samvat 794 was the 28th of October A D 737, which day was a Monday, and not a Sunday as stated in the inscription, and there was no eclipse on that date, Dr Buhler, therefore, suggests that, as "the figure for the year *probably* refers, as usual in Indian dates, to completed years, the grant must have been issued at the end of Kârtika (in Gujarât the first month) of Vikrama Samvat 795." Now this is *absolutely impossible* All Indian *dates* are given in completed years, and the Gujarât year of Vikrama Samvat 794 began on the 30th September 737 A.D, and ended on the 18th October 738 On this point there is no possibility of mistake, as the date is recorded in words as well as in figures It is true that there was an eclipse of the sun on the 18th October 738, but that date, according to Hindu reckoning, was the last day of Aswina, and was a Saturday and not a Sunday At present the Vikramâditya years begin with the 1st of Kârtika, but Abu Rihan mentions that in Sindh the year began with the following month of *Mânkhir*, or Mâigasiras* Now, if this was the case in the neighbouring country of Gujarât, the month of Kârtika would have fallen in the end of the year 794, and if there had been no intercalary month, the last day of Kârtika would have been the actual eclipse day, 18th October 738 A D But, according to the usual reckoning, the month of Ashâdha was intercalary in that year, so that the last day of Kârtika fell on the 16th of November As it is quite clear that there must be a mistake somewhere, I think it probable that it may be in the name of the month, I would, therefore, propose to read Aswina 794 for Kârtika 794, which would agree with the real eclipse day of 18th October 738 But as that day was a Saturday, a very inauspicious day, the writing of the grant was probably made on the following day, or Sunday, which was the first day of Kârtika, and this might have led to the substitution of the name of Kârtika for that of Aswina as the actual day of the eclipse

But a very much earlier date, presumably of Vikramâditya, has been brought to notice by Dr Buhler in one of the Gujarât inscriptions of Jayabhata, which, although no era is named, must also certainly be referred to the Vikramâditya Samvat† He reads the year as "Samvat 486, Sunday, the tenth day of the bright half of Ashâdha-Sudi, when the sun entered the sign of the Scorpion"

The Vikrama Samvat year 486 began in Gujarât, according to the present reckoning, on the 1st Kârtika-Sudi, or 28th September A.D 429,

* *Indian Antiquary*, Vol XII, p 155 † *Ibid*, Vol. V, p 114.

so that the 10th of Ashâdha-Sudi would have fallen in the following year, A.D. 430 As there was no intercalary month in that year, the 10th of Ashâdha-Sudi was the 99th day calculated from the 1st Chaitra-Sudi, or Tuesday, 11th March 430, which brings the date to Tuesday the 17th June, thus agreeing with the Tuesday already calculated by two Bombay authorities for Dr Buhler But as the day was a Sunday, according to the inscription, it seems to me not improbable that the date may not have been read quite correctly The only year which I can find that agrees with the week day indicated is Vikrama Samvat 497, in which year the 10th of Ashâdha-Sudi fell on Sunday, the 15th June A.D 441 If the figure for 80 was injured below, as the figure for 400 certainly was, then the decimal figure read as 80, might have been 90 and the Samvat year might, perhaps, be 497

In the Jain books also there is very early mention of the Vikrama Samvat Thus the Satrunjaya Mahâtmya professes to have been written 477 years after Vikrama, or in A.D 420, when "Silâditya, king of Vallabhi, expelled the Buddhists from Saurashtra, recovered Satrunjaya and other places of pilgrimage from them, and erected many Jain temples"* The era of Vikrama also is said to have been established by Vikramârka Raja 470 years after Mahâvira, or in 527 — 470 = 57 B C From the way in which he is spoken of as "honouring the advice of Siddha Sena Suri as the words of Jaina," it would appear that Vikramârka was a Jaina, which would account for the use of his era in the Jaina books, as well as for the non-mention of it in early Brahmanical inscriptions

Most of our early writers, as Colebrooke, Wilford, Tod, and Jervis, have vitiated their chronology by placing the initial point of the Vikramâditya era in 56 B C, instead of in 57 B C, as shown by Prinsep† The following examples from Colebrooke and Tod show how necessary it is to be strictly exact in dealing with dates

1 In one of "Three grants of land found at Ujjayini," the recorded date is an eclipse of the moon in Srâvana of 1200 Samvat Using the erroneous equation of 56, Colebrooke identifies this eclipse with that of the 16th July 1144 A D‡ But the true date was 1200 — 57 = 1143 A D, in which year there was an eclipse of the moon on 28th July, which day was also the full moon of Srâvana

* Dr Bhau Dâji, in Bombay Asiatic Society's Journal, Vol VI, 29-30

† See Prinsep's Useful Tables, p 82, where the origin of the error is pointed out.

‡ Colebrooke's Essays, Vol II, p. 264.

2 But Tod's mistake is even more curious He quotes the well-known Balabhi inscription, which gives the month of Ashâdha of the year 1320 of Vikrama along with the year 945 of the Balabhi era. He accordingly takes the year 375 [or 1320 — 945] of Vikrama as the initial point of the Balabhi era from which, deducting 56, he obtains A D 319 Here his equation of 56 gives a true result, because he is dealing with an inscription from Gujarât, where the Vikrama year does not begin until 1st Kârtika-Sudi In the same inscription the Hijra date is also given as 662 Now, as this year did not begin until the 4th November 1263, it is obvious that the Hindu month of Ashâdha, or June-July, must belong to A D 1264, and not to A D 1263 We thus learn that the Vikrama Samvat year referred to in the inscription must have begun in October, as is still the practice in Gujarât, and that the year 1320 must be reckoned from 1st Kârtika-Sudi, or from October A D 1263 to October 1264, and not from March 1263 to March 1264 The equation for the Gujarât reckoning of the Vikrama Samvat is, therefore, 56½, or, in round numbers, 56, which gives A D 1264 as the equivalent of the Vikrama Samvat 1320, as well as of the Hijra year 662 If the year of Vikrama had been reckoned from the last new moon preceding the vernal equinox, the date of the inscription would have been 1320 — 57 = 1263 A D, so that the month of Ashâdha (or June-July) would have fallen four months before the beginning of the Muhammadan year 662

XI —GRAHA-PARIVRITHI CYCLE

THIS is a cycle of 90 years, which is in use only in Southern India Warren has described it from the account of the Portuguese Missionary Beschi, who lived for forty years in Madura It begins in the Kâli-Yuga 3078, or B C 24 As the second cycle would have fallen in A D 76, it seems probable that it may have some connection with the Jyotishi cycle of Jupiter, which dates from the same period

XII.—SÂKA ERA.

THE *Sâka-kâl*, called also *Sâka-bhûpa-kâl* and *Sâkendra-kâl* or the "era of *the Saka King*," is perhaps more widely used than any other era Abu Rihân says that it was specially employed by the astronomers But Aryabata and his predecessors would appear to have made use of the Kâli-Yuga for all their calculations, and it was Varâha Mihira who first made use of the Sâka-kâl in astronomical works Abu Rihân, who correctly describes it as dating 135 years after Vikramâditya, says, that "Saka was the name of a king who reigned over the country situated between the Indus and the Sea, Vikramâditya marched against him and killed him in a battle fought near Korur, between Multân and the Fort of Luni" The town of Kahror still exists in the neighbourhood of Multân and Bahâwalpur. But this Vikramâditya, as Abu Rihân remarks, could not, owing to the long interval of 135 years, be the same as the famous prince who established the Vikrama Samvat The name of the Saka king was Sâlivâhan, and accordingly the era is now very generally called Sâka Sâlivâhana It is also known as the Sâka Samvat.

The reckoning of the Sâka era begins with the vernal equinox of the Kâli-Yuga year 3179, or A D 78 But as the Indians count only by completed years, the year 1 begins with the vernal equinox of Kâli-Yuga 3180, or A D. 79 In Northern and Southern India it is usually employed along with the luni-solar calendar, but in Bengal it is generally used with the solar calendar

In converting Sâka dates into Christian reckoning, 78 years must be added to the given date, and *vice versâ* to convert Christian dates into Sâka reckoning, 78 years must be deducted from the former

XIII.—GUPTA ERA

THE *Gupta-kâl*, or Gupta era, is not mentioned by any native writer, although it is found in several ancient inscriptions, as well as on the coins of the Gupta kings It is however noticed by Abu Rihân, who makes the singular mistake of dating it from the epoch of their extermination, and of confounding it with the era of Balabhi Now the initial point of the Balabhi era is known absolutely from Colonel Tod's inscription, which makes the year 1 = 319 A D, which is precisely the same date that is assigned to it by Abu Rihân, who says, that it is posterior to Sâka by 241 years, or 241 + 78 = 319 A D But as he goes on to say "Apparemment Ballaba suivit immediatement les Guptas," it is clear that the Guptas must have reigned *before* A D 319

The confusion about the two eras has probably arisen from the fact that the Balabhi kings, in all their copper-plate grants, continued to use the Gupta era instead of making use of the Balabhi era itself The following dates of the Gupta-kâl are found on the coins and inscriptions of the Gupta kings and in the records of their contemporaries

1	SAMUDRA GUPTA	Copper-plate, S 40
2	CHANDRA-GUPTA	Inscriptions, S 82 93
3	KUMARA-GUPTA	Inscription, S 96 98-126
4	SKANDA-GUPTA	Inscriptions, S 137-138-141-146 Coins, S 144-145 149
5	BUDHA GUPTA	Inscriptions, S 165 Coins, 174-180 odd
6	RAJA HASTIN	S 156-and year Mahâ Vaisâkha S 163 (read 173) year Mahâ Aswayuja S 191 ———— Mahâ Chaitra.
7	RAJA SANKSHOBA	S 209 ———— Mahâ Aswayuja.

The last four dates, which are recorded in two different reckonings, I have already made use of in my attempt to fix the initial point of the Gupta-kâl * The title of mahâ, prefixed to the names of the four years, shows that the reckoning belongs to the Lesser Bârhaspatya Chakra, or

* Archæological Survey of India, Vol X, Appendix.

12-year Cycle of Jupiter. This cycle I have already described, and as the General Table gives all the names of the years in due order, marking each period of the omission of a name by a black circle, it will be easy to follow the arrangement by a reference to the Tables

As the 12th part of one revolution of Jupiter is considerably more than four days less than one solar year, a difference which amounts to one whole year in a little more than 85 solar years, the rule is to omit every 86th name Now the double dates which I have given above show that, from the year 156 to 209 of the Gupta era, there was no name of the Jovian Cycle omitted As this fact seemed to me to offer a ready means of obtaining an approximate date for the beginning of the Gupta-kâl, I drew up a Table showing the names of all the years of the 12-year cycle from the beginning of the Christian era down to the present day Now as there was no omitted name between the years 156 and 209 of the Gupta era, or for a period of 54 years, the first date of Mahâ Vaisâkha, or Gupta-kâl 156, must lie within the period of 32 years (86 — 54) succeeding one of the omitted names On referring to the General Table, where the names of the years of the 12-year cycle are all given, it will be seen that the date of 156 Gupta-kâl must, therefore, lie within some one of the following periods

1 —A D 225 to 257, or 225 + 32
2 —A D 310 to 342, or 310 + 32
3 —A D. 395 to 427, or 395 + 32

In the first period the only dates on which Mahâ Vaisâkha falls are three, namely, A D 227, 239, 251 But as these dates would place the beginning of the Gupta era in A D 73, 81, or 95, they may be given up as too early

In the second period the dates of Mahâ Vaisâkha are A D 310, 322, 334 If 310 be taken as 156 of the Gupta-kâl, then the year 1 will fall in 310 — 155 = 155 A D This would place the date of Budha Gupta's Pillar in 154 + 165 = 319 A D, but as the week day of 12th Ashâdha-Sudi in Budha Gupta's inscription fell on a Tuesday in that year, and not on a *Thursday* as required, that date must be given up *

If the middle number 322 be taken as 156 of the Gupta-kâl, then the year 1 will fall in 322 — 155 = 167 A D, and the date of Budha Gupta's Pillar in 166 + 165 = 331 A D, in which year the 12th of Ashâdha-Sudi did fall on a *Thursday*

* Budha Gupta's inscription on the Pillar at Eran bears the date of Samvat 165, Thursday, 12th Ashâdha-Sudi.

If the third number 334 be taken as 156 of the Gupta-kâl, then the year 1 will fall in 334 − 155 = 179 A D, and the year 165 of Budha Gupta's Pillar in A.D 178 + 165 = 343, in which year the 12th Ashâdha-Sudi fell on a *Monday*

In the group of 85 years from A D 310 to 395, there is therefore only one year, A D 322, that will satisfy the two requirements of being a Mahâ Vaisâkha year itself, and of having a *Thursday* as the week day answering to 12th Ashâdha-Sudi of the year 165 of the Gupta era.

In the second group of 85 years from A D 395 to 480, the only dates on which Mahâ Vaisâkha falls within the limit of 54 years preceding 480, are the two years 405 and 417 A D, from which, deducting 155, we get the years 250 and 262 as two new starting points for the Gupta era

First, taking 250 as the year 1 of the Gupta-kâl, the year 165 will be A D 414, in which year the 12th of Ashâdha-Sudi fell on a Tuesday, and not on a Thursday

Next, taking 262 as the year 1 of the Gupta era, the year 165 will fall in A D 414, in which year the 12th of Ashâdha-Sudi fell on a Thursday, as required.

We have thus in the two-groups of years, extending from A D 310 to 395, only two dates which fulfil the two conditions of the Mahâ Vaisâkha year, and the 12th of Ashâdha-Sudi being a Thursday These two dates place the 1st year of the Gupta-kâl either in A D 167, or in A D 262

It is needless to try a third group of years, as the only possible Mahâ Vaisâkha dates would fall in A D 488 and 500, which would place the 1st year of the Gupta era in A D 333 or 345, both of which are certainly too late

When I submitted these results to my learned friend Pandit Bâpu Deva, he pointed out that the 12th of Ashâdha-Sudi in A D 331 was a Friday, and not a Thursday But it is so only by the reckoning of the Surya Siddhânta, which I have purposely rejected in dealing with these Gupta dates, as Varâha Mihira, the author of the Surya Siddhânta, lived at least two centuries later than Budha Gupta, so that it is quite impossible that his corrected tables could have been used in computing

the calendar of the Gupta period. My calculations have been made from the tables of Aryabhatta, according to which the 12th of Ashâdha-Sudi in A.D 331 was actually a Thursday. I am of course aware that Aryabhatta is also later than Budha Gupta, but as his length of year differs from that of his predecessor Parâsara by little more than half a second, the adoption of Aryabhatta's table will not affect the week day. The case is different with Varâha Mihira, as his year is considerably longer than that of Parâsara and Aryabhatta This difference was duly noticed by James Prinsep, who remarks that "Warren's Kâla Sankâlita gives the beginning of the Hindu solar year invariably *one day earlier* than the reckoning followed in the tables of the Sudder Dewânee. This arises from his using the Tamil year of the Arya Siddhânta, while the Surya Siddhânta is used in Bengal"

In A D 331, the Hindu luni-solar year began on the 23rd February, according to Cowasjee Patell, who, throughout his chronology, has used the tables of Aryabhatta In this year the month of Bhâdrapada was intercalary, but as this month is later than Ashâdha, the date will not be affected by the intercalation Now the 12th of Ashâdha-Sudi is the 101st day of the Hindu luni-solar year, and as the 23rd of February was a Tuesday, the 101st day was a Thursday in A D 331, according to Aryabhatta's tables But according to Varâha Mihira, the Hindu luni-solar year began one day later, on the 24th February, and consequently the 101st day would be Friday, 4th June

The result of this examination is that there are only two possible dates for the commencement of the Gupta era, which fulfill the conditions of the two tests which I have applied,—namely, A D. 167 and A D 262 We have accordingly to choose between these two dates that which agrees best with some of the other conditions.

By the first date, the period of Samudra Gupta, the son of Chandra Gupta I, the presumed founder of the era, would fall between the year 200 and 230 A D, which agrees with the fact that he was a contemporary of the Devaputra Shâhi, Shahân Shâhi, or the king of the Great Yue-chi Indo-Scythians.

By this earlier period also the date of Dhruva-bhatta would fall in 166+447=613 A D, or just 28 years before Hwen Thsang's visit to Balabhi in 641, during his reign.

Taking the later date of A.D 262, the period of Samudra Gupta would fall about A D 290 to 330, which would place him some considerable time after the Great Yue-chi had already got rid of their kings and had established military chiefs (? Satraps)

This later period also would fix the date of Dhrûva-bhatta in 261 + 447 = 708 A.D, or just 68 years after Hwen Thsang's visit, which is much too long a period for the reign of a single king

For these reasons I much prefer the earlier date of A D 167 as the first year of the Gupta era This earlier date also is attended by a curious coincidence, which seems to me to offer a very strong confirmation of its accuracy This is the correspondence in time of the death of Skanda Gupta with the foundation of the Balabhi era His latest inscription is dated in S 146, or A D 312, according to the earlier initial point which I have adopted But one of his silver coins in my cabinet is dated three years later, or in S 149, or A.D 315, which is within four years of the establishment of the Balabhi era I think it very probable, therefore, that the foundation of this era may have been brought about by the opportunity of Skanda Gupta's death This would agree very well with the statement of Abu Rihân, "that the fall of the Guptas corresponded with the establishment of the Balabhi era."*

In my attempt to fix the date of the Gupta era I overlooked a very important inscription of Silâditya V, the father of Dhrûva-bhatta of Balabhi This inscription is dated in S 441, while the son's inscription is only six years later. Supposing its dates to be recorded in the Gupta era, then Silâditya V would have been reigning in 166 + 441 = 607 A D, and his death may be placed about A D 610, or three years before the date of his son's inscription in S 447, or A D 613 Now Silâditya V was the tenth generation of the Balabhi kings, and if we place the foundation of the Balabhi monarchy in A D 319, the ten *generations* will have reigned from A D 318 to 610, or for 292 years, which gives an average of 29¼ years to each *generation* During this period there were 18 *reigns*, which give an average of nearly 16¼ years to each *reign*

That the era used by the Balabhi kings was that of the Guptas seems to be almost certain, as the Senapati Bhatâraka, the founder of the Balabhi dynasty, is said to have been the governor of Surâshtra during the last two years of Skanda Gupta's reign If then we accept the

* See Archæological Survey of India, Vol X, p. 125

year A.D 319 as the date of the foundation of the Balabhi monarchy, as well as of Balabhi itself, the Gupta era must be placed at least 146 years earlier, or in A D 173, according to the date of Skanda Gupta's latest inscription, or 149 years earlier, or in A D 170, according to the date of his latest coin. This direct succession of the Guptas by the Balabhis, already noted by Abu Rihân, is confirmed by the traditions of the people, which state that, on Skanda Gupta's death, the Senapati "assumed the title of king of Surâshtra," and "founded the city of Valabhinagar"* From these statements I gather that the Valabhi era must almost certainly be dated from the foundation of the city of Valabhi, which followed immediately after the death of Skanda Gupta. For this reason, therefore, I think that the date of A.D 166, which I have already deduced for the beginning of the Gupta era, from the copper-plate inscriptions of Raja Hastin and his son Sankshoba, compared with the week day date of Budha Gupta's Pillar at Eran, has a better claim for acceptance than any other that has yet been proposed

The new inscription of Jaika (which has not yet been published) has induced Dr Buhler to fix the beginning of the Gupta era about A D 206-209 But even the earlier date of 206 would place Silâditya V in 206+441=647 A.D, just six years later than the visit of Hwen Thsang, who found his son Dhrûva-bhatta on the throne

This inscription of Dhrûva-bhatta I had previously overlooked until my attention was drawn to it by Dr Burgess

It tells altogether in favour of any earlier date, for the inscription of Dhrûva-bhatta himself is dated in 447, or only six years later than that of his father

As the latest possible date for Silâditya V is 640 A D (the year before Hwen Thsang's visit), the latest possible starting point for the Gupta era is 640−446=194 A.D

According to my present calculation of the initial point of the Gupta era in A D 166=0, and 167=1, the date of Silâditya V will fall in 441+166=607 A D, and that of his son Dhrûva-bhatta in 447+166=613, A D

The published inscription of Jaika, from Morbi, is dated in the year 585 of the Gupta-kâl, or era of the Guptas. It records a grant made

* *Indian Antiquary*, 1873, p 312 Notes by Major Watson

on the occasion of a solar eclipse, but the inscription itself is dated on the 5th of Phâlguna-Sudi, which was not therefore the date of the grant, as a solar eclipse can only happen on *badi* 14th or the last day of the waning moon According to my calculation of the initial point of the Gupta era, the year 585 will correspond with 585+166 = 751 A D, in which year there was an eclipse of the sun on the 25th of August

It is true that this date is about five months earlier than the actual date of the record But this is not a difficulty of any consequence, as we have a similar interval between the actual date of a grant and the date of its record on copper in the Râjim inscription of Tivara Deva, king of Kosala His grant was made on the 12th of the solar month of Jyeshta, but was not recorded until the 8th of Kârtika, or just four days less than five months later The day of the month I have read myself, as it is not given by Wilson in his Translation, see Asiatic Researches, Vol. XV The eighth day of Kârtik is recorded both in words and in figures

XIV —CHEDI, OR KALÂCHURI-SAMVAT.

—o—

THERE is a considerable number of inscriptions of the Kalâchuri Rajas of Chedi, with various dates from S 792 to S 934, which, from the style of their characters, as well as from the names of other kings mentioned in them, cannot possibly be referred to the era of Vikrama The actual name of the era was discovered by Mr Beglar in several inscriptions from the district of Raypur to the east of Nâgpur In some it is named the *Chedi*-Samvat, and in others the *Kalachuri-Samvat* All the then available dates have been discussed in my account of the Kalâchuri inscriptions* From these I deduced that the initial point of the era must have been A.D 249, "as that year gives the correct week days by computation for *four* of the recorded dates" Since then I have been able to correct two of the discrepant dates noticed in my account, while I have myself found two new dates As all of these give the correct week day when calculated from the initial point of 249 A.D = 0, and 250 = 1, I feel satisfied that this is the true starting point of the Chedi era.

During my late tour in the Central Provinces I obtained the two new inscriptions of the Kalâchuri or Chedi-Samvat already mentioned The date of the earlier one is given as *Samvat* 866, *Mârga-Sudi 9, Ravau*, or "Sunday the 9th of the waxing moon of Mârga, 866" Taking my previously ascertained starting point of the era in A D 250 = 1, the date will be 866 + 249 = A D 1115, in which year Jyeshta was intercalary, and the 9th of Mârga-Sudi fell on a Sunday

The date of the second inscription is *Samvat* 934, *Kârttika-Sudi* 5, *Budhe*, or "Wednesday the 5th of the waxing moon of Kârttika in the year 934" Adding 249 to 934 we get the year A.D 1183, in which the 15th of *Kârtika-Sudi* was a Wednesday

* Archæological Survey of India, IX, 112, *et ante.*

One of the discrepant dates, noted in my previous account, was that of the Benares inscription of Karna Deva, which I gave as "Samvat 793, Phâlgun-Badi 9th Monday" But as the 9th of Phâlgun-Badi in 793 + 249 = A.D 1142 was a Sunday, I have come to the conclusion that I may perhaps have misread 793 for 792

This conclusion was suggested to me by the fact that Wilford read the unit as 2, and that the 9th of Phâlguna-Badi in the preceding year, or 792 + 249 = A D 1141, was actually a Monday.

The other correction is in the day of the month in the year 898, which I read as Aswina-Sudi 7, instead of Aswina-Sudi 2, which a fresh examination has shown it to be As the 7th was a Saturday (as noted in my previous account), the 2nd was of course a Monday, as stated in the inscription We have thus got no less than eight dates, all of which agree in placing the initial point of the Chedi or Kalâchuri era in A.D 249—the year 250 being reckoned as 1

There are three inscriptions which give the name of "*Kalâchuri-Samvat*," dated respectively in 896, 898, and 910, but the first two only name the week day Two other inscriptions, dated in 919 and 933, give the name of "*Chedi-Samvat*," but they do not give the week days.

The initial point of the Chedi or Kalâchuri-Samvat is therefore satisfactorily established by the eight following inscriptions, in which the calculated week days agree exactly with the recorded ones —

Inscription	Chedi S	A D	
Benares	792	1041	Phâlgun Badi 9, Monday
Nâgpur museum	866	1115	Mârga Sudi 9, Sunday
Rajim	896	1145	Mâgha Sudi 8, Wednesday
Seorinârayan	898	1147	Aswina Sudi 2, Monday
Tewar	902	1151	Ashâdha Sudi 1, Sunday
Bhera-Ghât	907	1156	Mârgasiras Sudi, Sunday
Bhera-Ghât	928	1177	Mâgha Badi 10, Monday
Sahaspur	934	1183	Karttika Sudi 5 Wednesday

I must mention, however, that there are two other inscriptions in which the calculated week day differs by one day from that recorded. These are—

Bharhut	909	1158	Sravana Sudi 5, Wednesday, comes out Thursday
Tewar	928	1177	Srâvana-Sudi 6, Sunday, comes out Monday

The Rajas of Chedi are mentioned in the inscriptions of the neighbouring kings from A D 520 downwards But the earliest Prince mentioned in their own inscriptions is Kokalla I, the contemporary of Bhoja of Kanauj, whose dates we know to have ranged from A D 875 to 900 From his time down to the close of the dynasty, the Kalâchuri Princes played a principal part in the history of Central India Their capital was at Tripura, now Tewar, six miles to the west of Jabalpur But there was an eastern branch of the family which ruled at Ratanpur, of whom very little is at present known A list of the Rajas of this family is given in the Gazetteer of the Central Provinces Some of the names correspond with those found in the inscriptions, but the dates are all wrong, as they have been referred to the Samvat of Vikramâditya, instead of to the local Chedi era of the country.

XV.—ERA OF BALABHI.

—o—

THE initial point of the *Balabhi-kâl*, or era of Balabhi, is fixed by the account of Abu Rihân, as well as by the other dates recorded in Tod's inscription, to the year 319 A D According to the former, it was 241 years posterior to the Sâka, or 78 + 241 = 319 A D According to the inscription, Sunday the 13th Ashâdha-Badi of the year 945 of *Srimad Balabhi*, fell in the year 662 of *Muhammad*, 1320 of *Vikrama*, and 151 of the *Swa Singha Samvat** The first year of the Balabhi era was fixed by Tod by deducting 975 from 1320, which gives 375 of the Vikrama Samvat as the year 1 of the Balabhi Samvat Then, deducting 56 from 375, he obtained 319 A D as the equivalent in the Christian era

Now the difference between the Christian and the Vikrama starting points being nearly 57 years, the equivalent for Vikrama 375 should be 318, and not 319 But as we know from Abu Rihân that the Balabhi era actually began in 319, some explanation is required to show how Tod's erroneous factor of 56 gave the right year A D The explanation is a very simple one,—namely, that the Vikramâditya years in the province of Gujarât, where the inscription was found, began then, as they do now, with the month of *Kârtika* or October, and consequently the true factor for converting the Vikrama date into the Christian equivalent was 56½, or 56 as used by Tod The proof of this is equally simple The Hijra year 662 did not begin until the 4th of November 1263 A D This being the case, the month of Ashâdha (or June-July) of the Christian year 1263 had already passed by, and therefore the Ashâdha of Samvat 1320 of the Northern reckoning cannot belong to that year But if we take the Southern reckoning prevalent in Gujarât, then 56 will become the nearest factor, and Tod's 375 − 56 will give the correct year A.D 319. Then deducting 56 from the given Samvat year 1320, we get A D 1264 as the concurrent Christian year This agrees exactly with the given year of Muhammad, 662, which began on 4th November 1263, and ended on the 23rd October 1264

So far as I am aware Tod's inscription is the only one that has yet been found dated in the Balabhi era

---

* Tod's Rajasthan, I, 801

XVI.—SRI-HARSHA ERA.

—o—

THE *Sri-Harsha-kâl*, or "Era of Sri-Harsha," is mentioned only by Abu Rihân. Its initial point shows that it was established by the famous king Sri Harsha Vardhana of Kanauj, from the 1st year of his reign It was used in Mathura and Kanauj, and Abu Rihân gives its initial point from the Almanacs of Kashmir as 664 years posterior to Vikramâditya, or $664-57 = 607$ A.D* I brought to notice some years ago one inscription of Bhoja Deva of Kanauj, which is certainly dated in this era. This inscription is at Prithudaka, or Pehoa, and is dated both in words and in figures in the year 276 Referring this to the era of Sri-Harsha we get $606+276 = 882$ A D †

But the inscriptions found in Nepâl by Pandit Bhagwân Lâl offer still earlier instances of the use of this era ‡ The earliest of these records, bearing the name of Ansu Varma, are dated in Samvat 34, 39, and 45 Now Ansu Varma was on the throne when the Chinese pilgrim Hwen Thsang visited Nepâl in A D 637, which was in the very middle of his reign, as his earliest inscription above quoted is dated in A D 640 (606+34) and his latest in A D 651, which was near the close of his reign, as an inscription of his successor, Jishnu Gupta, is dated in S 48, or A D 654 Three inscriptions of Siva Deva are dated respectively in S 119, 143, 145, and one of Jaya Deva in S 153, or A.D. 759. Now Jaya Deva's mother is said to have been the grand-daughter of the "Great Aditya Sena, the illustrious lord of Magadha," of whom I have an inscription dated in S 55, as I read the two figures This would place Aditya in A D 661, or 64 years prior to his grand-daughter, the wife of Siva Deva

---

* Renaud, Fragments Arabes et Persans, p 139

† See Archæological Survey, X, 101, for other inscriptions of Bhoja Deva, Gwalior A D 876, and Deogarh A D 862 The Raja Tarangini also places him between 883 and 901 A D

‡ *Indian Antiquary*, Vol. IX, p 169, *et seq*

In A D 880 the Newâr era was introduced into Nepâl by Râghaba Deva. He is the sixth Prince in the Nepâl list after Jaya Deva, and if Jaya reigned until about 170 of the Harsha era, or A D 776, there would remain only 104 years to be divided over the five intervening reigns

None of the inscriptions describe the era by name, but call it simply Samvat But, from the mention of Ansu Varma as the reigning king of Nepâl by Hwen Thsang, it is quite clear that the dates which I have quoted must belong to the Sri-Harsha era According to the lists Ansu had one predecessor Siva Deva Varma, who, as he belonged to the old family that had been expelled, was very probably restored by the powerful king of Kanauj, whose era he adopted

There are two copper-plate inscriptions of the family of the Kanauj kings, who reigned from about 750 to 1,000 A D The earlier plate is of Mahendra Pâla Deva, the son of Bhoja Deva, whose date I have fixed from several other inscriptions as extending from A D 870 to 900 The date of Mahendra's plate may be read as 315, which, referred to the Sri-Harsha era, would place him in A D 921 The later plate is of Sri Vinayaka Pâla Deva, the grandson of Mahendra Pâla Its date seems to be 386, which would place him in A D 992 * Shortly after this, Kanauj was conquered by the Râthors, who introduced the Samvat of Vikramâditya

* For the first plate, see Bengal Asiatic Society's Journal, XXXIII, 321, and for the second plate, see the same Journal, XVII, 71

XVII.—HIJRA ERA

—o—

THIS era dates from the morning after the flight (*Hijra*) of Muhammad from Mekka to Medina, which took place on the night of the 15th July A D 622 The year 1, therefore, began on *Friday, 16th July* 622 The year is a simple lunar one of 12 lunations or lunar months, of 30 and 29 days alternately The common year, therefore, consists of only 354 days But as a month of 29½ days is somewhat less than one mean lunation, an intercalary day is added to the last month in the 2nd, 5th, 7th, 10th, 13th, 16th, 18th, 21st, 24th, 26th, and 29th years of each period of 30 years, so that the year consists of $354\frac{11}{30}$ days, which makes the mean lunation $29\frac{12}{360}$ days, or 29 5305555 This differs from the mean synodical revolution of European astronomers by only 0000332 of a day The Muhammadan lunar year of $354\frac{11}{30}$, or 354 3666 days, is, therefore, 0 970202 of the solar year of 365 25 days of the Julian reckoning

To find whether any given year is intercalary, divide it by 30, and if the remainder be either 2, 5, 7, 10, 13, 16, 18, 21, 24, 26, or 29, then the year is an intercalary one of 355 days, but if it be any other number, the year is a common one of 354 days

But to save the trouble of calculation for finding on what day of the Christian era any particular Hijra date falls, I have prepared two tables, by which the corresponding date can be obtained in a much shorter time by inspection

Thus, to find the corresponding date of Timur's capture of Delhi, which he has himself recorded as "Wednesday the 8th of the 2nd Rabi 801 A H," first look in Table XVI for the initial day of the Muhammadan year in Christian reckoning, which was Friday the 13th September 1398. Then turn to Table XV, and look for the place of II Rabi 8, from which run the eye upwards to the horizontal line of week

days, beginning with Friday, where the intersection will be found to fall on Wednesday, thus agreeing with the week day given by Timur Next look to the Roman numerals on the right, where it will be seen that "II Rabi 8" was the 6th day of the 13th week, or the 97th day of the Muhammadan year Then calculate from the 13th September 1398 as the 1st day as follows —

In September	18 days
„ October	31 „
„ November	30 „
„ December	18 „
Total .	97 days.

The corresponding Christian date was, therefore, the 18th December 1398, which, by the tables of the Christian calendar, was a Wednesday.

The following dates taken from several different authors agree with the tables

				Page
A. H 422	Muharram 1 = Tuesday	*Baihaki*, H M Elliot, II,		61
633	Shabân 29 = Tuesday	*Minhâj*, H M Elliot, II,		330
638	Muharram 8 = Monday			338
640	Rajab 9 = Friday			343
645	Muharram 2 = Thursday			347
655	I Rabi 6 = Sunday			356
656	Muharram 6 = Sunday			358
801	II Rabi 8 = Wednesday,	Timur's own date of capture of Delhi, H M E, III		443

Dowson erroneously gives 17th December 1398 as the European date of the capture instead of 18th The 17th December was Tuesday—

A. H 912	II Jamadi 8	Monday	Babar's Memoirs,	page 201
925	Muharram 1	Monday	„	246
925	I Rabi 11	Sunday	„	260
932	Safar 1	Friday	„	290
933	I Rabi 16	Friday	„	347
936	Muharram 3	Tuesday	„	425
949	Rajab 5	Sunday	Akbar born —Blochmann	
963	II Rabi 2	Friday	Akbar placed on throne at Kalanor by Bairâm	

Occasionally, however, the week days of both inscriptions and books will be found to differ *one* day from the week days of the tables If this should be the case in several instances of the same writer, the discrepancy must be due to his having used a slightly different order of the intercalary years. The numbers of the intercalary years which I have used in the accompanying Tables are those of Ulugh Beg, which

are the most generally accepted,—namely—2—5—7—10—13—16—18—21—24—26—29. But according to Jervis the Indian Almanacs give three of the numbers differently, or one in each decade of each cycle. These different numbers are 8, 19 and 27, instead of 7, 18 and 26 The result is, that where the years 8, 19 and 27 are made intercalary, those years will begin one day *earlier* than in the Tables, and every day throughout each of those years will also be one day earlier In the accompanying Tables I have placed Roman numerals against the intercalary years of the accepted reckoning, and stars against the three years which differ

I have found this discrepancy of a single day in the following dates —

		Recorded Date.		*Date by Tables*		
A H. 630	Safar	20	Tuesday	Monday	Minhâj, H M Elliott, II,	327
634	Rajab	6	Friday	Thursday		
882	Muharram	1	Wednesday	Tuesday	Pandua inscription	
899	Ramzân	4	Monday	Sunday	Babar's Memoirs	7
926	Muharram	1	Saturday	Friday	..	281
934	Muharram	1	Saturday	Friday		373
977	I Rabî	17	Wednesday	Tuesday	Jahângir born	
1000	II Jamâdi	6	Saturday	Friday	Tabakâtu Akbari	

It must be confessed, however, that not one of the above dates falls in the 8th, the 19th, or the 27th years, so that I can only suggest carelessness on the part of the writers as the probable explanation of the discrepancies. The following more glaring instances will be sufficient to show that even the best Muhammadan authors are not free from errors of this kind

Minhâj—A. H 634, I Rabi 18—*Sunday*, should be *Wednesday*.
————A H 637, Ramzan 27—*Monday*, should be *Friday*
Baber—A. H. 933, Muharram 25—*Monday*, should be *Thursday*

This last mistake has been noticed by Erskine

In using the general table of the initial days of the Hijra years, it is only necessary to remember that all the dates up to the beginning of A.D. 1753 are given in Julian reckoning or Old Style, and from that date in Gregorian reckoning or New Style The week days of course remain unchanged, whichever reckoning is used The correction of the calendar took place in Engalnd in A D 1752, when eleven days were struck out after the 2nd September, making the next day the 14th instead of the 3rd This change occurred towards the end of the Hijra year 1165 In the table I have given the beginning of the year 1166 in the New Style as Wednesday the 8th November 1752 By the Old Style reckoning the date would have been Wednesday, 28th October

To find the day of the week on which any given year of the Hijra began, the following rule is given by Woolhouse—

1*st*—Find the year of the current cycle by dividing the proposed Hijra year by 30

2*nd*—Divide the number of cycles thus obtained by 7, to obtain the number of the period

Now take the year 1000 A H as an example—

$$\begin{array}{lll} & \text{1000 A H} & \text{33 cycles} \\ 30 & \overline{\qquad\qquad} & 7\ \overline{\qquad\qquad} \\ \text{Cycles} & 33 + 10 = \text{current year of cycle} & 4 + 5 = \text{number of period} \end{array}$$

Then look in the following table for the intersection of the current year of the cycle, or 10, with the number of the period, or 5, and it will be found that the initial day is Saturday, which is correct

Current year of the cycle				Number of the period of 7 cycles						
				0	1	2	3	4	5	6
0	8			Mon	Sat	Thur	Tues	S	Frid	Wed
1	9	17	25	Frid	Wed.	Mon	Sat	Thur	Tues	S
*2	*10	*18	*26	Tues.	S	Frid	Wed	Mon	Sat	Thur
3	11	19	27	S	Frid.	Wed	Mon	Sat	Thur	Tues.
4	12	20	28	Thur	Tues	S	Frid	Wed	Mon	Sat
*5	*13	*21	*29	Mon	Sat	Thur	Tues	S	Frid	Wed
6	14	22	30	Sat	Thur	Tues	S	Frid	Wed	Mon
*7	15	23		Wed	Mon	Sat	Thur	Tues	S	Frid.
	*16	*24		S	Frid	Wed	Mon	Sat	Thur	Tues

The calculation of this table is based on the fact that as the cycle consists of 30 years, the whole series of week day changes will be exhausted in each period of $30 \times 7 = 210$ years.' Thus the year 1 A H having begun on a Friday, the following years would also begin on Friday.—

		O S.	
A. H 1	= Friday, 16th July	622	A D
211	= Friday, 13th April	826	,,
421	= Friday, 9th January	1030	,,
631	= Friday, 7th October	1233	,,
841	= Friday, 5th July	1437	,,
1051	= Friday, 2nd April	1641	,,
1261	= Friday, 10th January	1845	N S

As the calendar was corrected in England in A. D. 1752, during the currency of the Hijra year 1165, the last entry is given in New Style, or Gregorian reckoning

But the initial week day of any given year of the Hijra can also be obtained by a short calculation, starting from any one of the above periods Thus taking the year 1000 A H as before, and remembering that the intercalary days are inserted in the following years of each cycle—

2 5 — 7 10 — 13 — 16 — 18 — 21 24 26 29

The calculation is as follows —

1000 A H. — 841 = 159 years
× 4 = No of days in each year in excess of 50 weeks
636 days
150 years = 5 cycles = 55 days at 11 intercalary days per cycle of 30 years
In 9 years over 5 cycles = 3 intercalary days [2nd, 5th, 8th years]
159 Total 694 days
+ 7
Weeks 99 + 1 day = Saturday

that is, one day over Friday = Saturday, the same as derived from Woolhouse's Table *

When a full table is not at hand for finding a date by simple inspection, either of the above methods will be found very useful, as both are absolutely correct

* Woolhouse's account of the Hijra Era will be found in "Weights and Measures of all Nations."— *Weale*, 1856.

XVIII.—THE BURMESE COMMON ERA

—o—

THE common era of Burma which is now in use is the luni-solar calendar, which was introduced from India in A D 638 The length of the year is exactly the same as that of the Surya Siddhânta, namely, 365 875648 days The solar year is reckoned in the same way as that of the Hindus, and accordingly it now begins on the 12th and 13th of April, which is the calculated date of the sun's entrance into Aries according to Hindu reckoning The luni-solar year has 12 lunar months of 29 and 30 days alternately, with an intercalary month at seven fixed periods in each cycle of 19 years The years in which these intercalary months are inserted are the

2nd, 5th, 7th, 10th, 13th, 15th, 18th

But the extra month is always inserted in the same part of the year after the month of Wahso, and is consequently named the second Wahso The names of the 12 months are the following —

1	Tàgu	Chaitra	March-April
2	Kasong	Vaisâkha	April-May
3	Nayoung	Jyeshtha	May-June
4	Wahso	Ashâdha	June July
5	Wahgoung	Srâvana	July-August
6	Tauthalin	Bhâdrpada	August September
7	Thadinkyut	Aswina	September-October
8	Tasoung mong	Kârtika	October-November
9	Natdart	Agrahayana	November-December
10	Payatho	Pausha	December-January
11.	Tabodweh	Mâgha	January-February
12	Taboung	Phâlguna	February March

The year begins with the new moon immediately preceding the commencement of the solar year, and ends with the 30th day of Taboung

The initial point of the era is Saturday the 21st March A D 638 of the Julian reckoning, or 24th March A D 638 of the Gregorian reckoning In computing any date the calculation is much simpler than that of the usual rules for the Hindu luni-solar year, as the reckoning

is referred to the beginning of the era, and not to the beginning of a yuga or mahâ-yuga several thousands of years back The process is otherwise the same as that for any day of the Hindu luni-solar year, with the exception that the fixed position of the intercalary month saves some trouble

To ascertain whether any particular year will be intercalary or not, it is only necessary to divide the number by 19, and if the remainder be either 2, 5, 7, 10, 13, 15, 18, then an intercalary month will be added in that year; but if it be any other number the year will be an ordinary one.

In India the only examples of Burmese dates that have hitherto been met with are in the few Burmese inscriptions found at the Mahâbodhi temple at Buddha Gaya. Three of these, which refer to the Great Temple itself, are of so much importance that I gladly take this opportunity of giving my readings of their dates The longest inscription is on a stone slab which was found by the Burmese embassy fixed in one of the inner walls of the Mahant's residence Three translations of it have been published,—1*st*, by Ratna Pala, a Singhalese Pali scholar, 2*nd*, by Colonel Burney, and 3*rd*, by Mr Hla Oung, a Burmese scholar. The inscription professes to record the history of the original building and the successive repairs of the temple Two dates are given in figures, accompanied, in each case, by the day of the week as well as the day of the month. The following is a brief abstract of this valuable record —

1—Asoka built the first temple

2—Temple rebuilt by Naik Mahanta

3—Temple restored by Raja Sado-Meng

4—Raja Sempyu-Sakhen-tara-Mengi deputed his guru Sri Dhamma Râja Guna to superintend the restoration of the temple work not completed

5—Varadasi Naik Thera petitioned the Raja to undertake the work, which was then entrusted to "the younger Pyu-Sakheng" and his minister Ratha

This last work was begun in the Sakka Raj year 441, on Friday the 10th of Pyadola, and finished in 448, on Sunday the 8th of Tachung Mangla (or Tasoung-Mong)

Here I have given my own reading of the dates as 441 and 448, for the following reasons

A copper gilt canopy, which was found by Mr Beglar carefully buried eight feet under the ground level to the west of the Great Temple, bears two inscriptions in Burmese and mediæval Indian characters

The Burmese inscription is much injured, but I can still read the name of *Sri Dhamma* in it The Indian inscription, which is nearly perfect, opens as follows —

Sam 391, *Sri Dharma Raja Guru*

Here the date which is very clearly inscribed can only be referred to the Burmese common era of A D 638, which fixes the period of Dharma Raja Guru's visit to 391 + 638 = A D 1029 Now the account of the later mission of "the younger Pyu-Sakheng" shows that it must have followed not long after Dharma Raja Guru's Mission I therefore read the two dates as 441 and 448, in preference to the very much later dates of 667 and 668, which had been generally adopted previously I have tested all the possible readings of these dates as 641, 647, 661, 667, 648, and 668, by the week days mentioned in the inscription Not one of them stands this test, whereas the two dates of 441 and 448 which I have adopted do actually agree with the week days recorded in the inscription The evidence in favour of my readings is, therefore, doubly strong The later history of the temple will therefore be as follows

Burmese era 391 = A D 1929—Dharma Raja Guru's Mission
——————— 441 = A D 1079—Restoration of temple begun by the younger Pyu-Sakheng
——————— 448 = A D 1086—Completion of the work

These readings of the dates allow a period of 6 years and 10 months for the restoration, instead of the short period of only 10 months allowed by the former readings

The two dates noted in the inscription correspond, according to my calculations, with the following European dates

1 Sakka Raj year 441, Friday, 10th of Pyadola was Friday, 6th December A D 1079.

2 Sakka Raj year 448, Sunday, 8th of Tachung Mangla was Sunday, 18th October A D 1086

XIX.—NEWAR ERA.

—o—

THE Newâr era is peculiar to Nepâl, where it was introduced in A.D 880 by Raja Râghava Deva Pandit Bhagwân Lâl Indarji has published several inscriptions dated in this era. The earliest date is S 533, or A D 1413, of Raja Jyoti Malla, who may be the *Jestili* Mall of Prinsep's List The next is one of Siddhi Nri-Sinha, dated in S 757, or A.D. 1637. This Prince must be the Siddha Nara Sinha of Prinsep's List, whose reign is assigned to A D 1654—1685 But this inscription places him at least seventeen years earlier He was the grandson of Jaya-kusa Malla by his daughter, to whom was left the district of Pâtan A third and a fourth inscription furnish another correction These are records of Pratâpa Malla of Kâthmându, dated in S 769 and 778, or A D 1649 and 1658, which serve to place this Raja seven years earlier than in Prinsep's List

Prinsep obtained his information from Dr Bramley, who was Residency Surgeon in Nepâl. The year begins in October, and 951 years had expired in 1831. The Newâr era is used upon the coins of the Newâri Rajas of Bhatgaon, Kâthmându, and Pâtan Marsden has published coins of Jaya Prakâsa Malla II. of Kâthmându, dated in S. 819 and 823, or A D. 1699 and 1703, which agree with the dates of 1606 and 1706 given in Prinsep's List This era was discarded in A.D. 1768 by the Gorkha conqueror Prithi Nârâyana Sâh, who introduced the use of the Sâka era, which is still placed on all the coins of Nepâl.

XX.—CHÂLUKYA ERA.

— o —

In the Châlukya inscriptions the dates are generally recorded in the Sâka era But in the year *Nala* of the Jovian cycle of 60 years, or A D 1076,* the Châlukya king Vikramâditya Tribhuvana Malla established a new era called the *Châlukya Vikrama Varsha* From his own inscription we learn that he set aside "the ancient Saka, and established the Vikrama Saka in his own name"† He reigned for fifty-one years from Saka 998 to 1049 His era dates from his accession in Saka 998, or A D 1076 He was one of the most powerful of the Châlukya kings, and his era seems to have been adopted by some of the neighbouring princes Thus the Kadamba king Tailapa Deva dates one of his inscriptions on "Monday, the full moon day called Herjuggi (or Aswina) of the *Sarvadhâri* Samvatsara, which was the thirty-third year of the glorious *Châlukya Vikrama Varsha*" Sarvadhâri, the twenty-second year of the cycle, fell in A D 1108 in Southern India, and as it was the thirty-third year of the new Châlukaya era, the first year must have fallen in 1108 − 32 = 1076 A D

After the death of Vikrama in A D 1127 the power of the Châlukyas began rapidly to decline, and in Saka 1084, or A.D 1162, their throne was seized by Vijala Kalâchuri, after which their era would seem to have fallen into disuse

---

* Brown's Cyclic Tables, pp 2, 57.

† Royal Asiatic Society's Journal, IV, 14.

XXI.—ERA OF LAKSHMANA SENA.

THE earliest notice of this era by name occurs in an inscription from Buddha Gaya published by James Prinsep, in which the date is thus given

Srî Mat Lakshmana Sena Deva pâdânam-
-atîta râjye Sam 74, *Vaisâkha badi* 12, *Guran*

"The reign of Srî Mad Lakshmana Sena Deva having *passed*," or as Babu Râjendra Lala translates it—

"After the *expiration* of the reign of the auspicious Lakshmana Sena Deva"

This era, therefore, was established on the death of Lakshmana Sena, the son of Ballâla Sena, Râja of Bengal It is still used in Tirhut and Mithila in almanacs, but always along with the better known eras either of Vikrama or Sâka Unfortunately the people, who thus use it, know nothing about it, and the equivalent dates give slightly varying results I believe, however, that I have succeeded in clearing up the difference I number the following statements for easy reference hereafter —

1 The earliest mention of the era is by Colebrooke, who speaks of "Lakshmana Sena as a renowned monarch who gave his name to an era of which 692 years are expired"* The Preface containing this statement is dated 17th December 1796 the year in which this era was established must have been A D 1104, and A D 1105 would have been the year 1 expired

2. The next mention is by Buchanan, who says that, according to the almanacs of Mithila, A D 1810 was the 706th year of the era of Lakshmana Sena, which, as he remarks, places its beginning in A D 1104†

3 In another place, however, he gives a slightly different statement as follows "In Mithila the year is lunar (*i e* luni-solar) and commences

---

* Preface to the Digest of Indian Law—Essays, I, 472.

† Buchanan's Eastern India, III, 41 and 139

on the first day after the full moon of Ashâdha Here they say that Sak was the same as Sâlivâhan, and this year 1810 is reckoned the 1732nd year of his era It is also the 1866th year of Samvat, who, according to them, is the same with Vikram In these two points they agree with the Brahmans of the South, and differ totally from those of Bengal They have still another era called after Lakshman, king of Gaur, and of which this is the 705th year"

4 Babu Râjendra Lâla mentions the *Sadukti-karnâmrita* as bearing the two dates of Saka 1127 and Lakshmana Sena era *rasa+eka+ninsa* * The book was written by Sridhara Dâsa, son of Vatsa Dâsa, a general under Lakshmana Sena The words expressing the date are unfortunately defective

5 Babu Râjendra also notes that the *Dâna-Sâgara* was written in Saka 1019, or A D 1097, by Halâyudha, the spiritual adviser of Lakshmana Sena † I mention this for two reasons 1*st*, because it shows that Lakshmana Sena I was reigning *before* A D 1170, when the era was established, and 2*nd*, because this Lakshmana must be a different prince from the Lakshmana of No 4, who can only have been Lakshmana Sena II, or Lakshmaniya

6 A copper-plate inscription of Siva Sinha Deva, Raja of Tirhut, gives the following dates — "*Lakshmana Samvat* 293, *Srâvana-Sudi* 7, *Guruu*," coupled with "*Saka* 1321, and *Samvat* 1455" The Saka date is equivalent to A D 1399, but the Vikrama date of 1455 gives A D 1398 The difference between the two dates is only 134 years instead of 135 This difference was also noticed by Buchanan, who states that Kamalakânta, the most learned Brahman in the Rangpur district, made the Samvat era begin 134 years before that of Saka ‡ In the Mithila district he found the same, as he notes (see No 2) that the year 1810 A D was reckoned as Sake 1732 and Samvat 1866, without 134 years' difference As the Sake date is the correct one, I have adopted it in preference to the Samvat date, which is but little used in Bengal But the best proof of its accuracy is the fact that it agrees with the week day mentioned in the copper-plate The dates are Thursday the 7th Srâvana-Sudi, 1321 Sake, or A D 1399 As the proof of this is very simple, I give it here as another example of the general accuracy of the

* Notices of Sanskrit Manuscript, III, pp 134, 149

† Bengal Asiatic Society's Journal, 1865, p 137.

‡ Eastern India, III, p. 506

tables for working out any luni-solar date Sake 1321 = Kâli-Yuga 4500—

	Solar Ahargana	*Luni-solar Ahargana.*
4500 years	= 1643,664 4042 days	1594,651 7489 days
Deduct constant	—2 1475	
	1643,662 2567 days ÷ 7 =	6 2 days over
	1594,651 7489	= Thursday, 27th March 1399, 1st day of Solar year
	49,010 5078	
1600 lunations =	47 248 9406	= 27th March
	1761 5672	— 19 days
59 lunations =	1742 3046	—
		8th March = 1st day of luni-solar year

Luni solar year begins 19 6626 days earlier

and as Srâvana-Sudi 7th is the 125th day of the year, it fell on Thursday, 10th July 1399, O S

7 There is another inscription dated in the era of Lakshmana Sena, which also gives the week day Prinsep read it as Sam 74,* which would be equivalent to A D 1180 and Kâli-Yuga 4281 This is the inscription referred to in the beginning of this account as being dated from the close of the reign of Lakshmana Sena But taking Prinsep's reading of the year as S 74, my calculation shows that the week day does not agree with *Thursday*, Vaisâkha-Badi 12

8 I possess a third inscription dated in *Sri Mal Lakshmana Senasyâtita râjye Sam* 51 "In the year 51 *after the close* of the reign of Sri Lakshmana Sena" Then follow some letters and figures which, no doubt, give the month and the day, but I have not yet been able to read them

In noticing the almanacs of Mithila, which mention this era, I have said that the equivalent dates give slightly varying results. This is even the case with the two notices of Buchanan, who in one place gives the year 705 of the Lakshmana era as the equivalent of A.D. 1810, and in the second place, 706

9. Babu Râjendra Lâla Mitra has collected several instances of the use of this era by the people of Tirhut† He quotes Babu Rajakrishna Mukarji as having brought to notice the fact that it was still current

* Bengal Asiatic Society's Journal, Vol. V, p. 657

† *Ibid*, 1878, p. 396.

in Tirhut, and that A D 1874 was the year 767 of the Lakshmana era. Deducting 766 from each number we get A D 1108 as the year 1 of the era

I also obtained several equivalent dates from some manuscript Tirhut almanacs in the possession of Pandit Babu Lâl of Darbhanga

10 The oldest of these was dated in Saka 1698, and Lakshmana Sam 669, and Vikrama Sam 1833, equivalent to A D 1776 Deducting 668 we get A D 1108 = the year 1 of the Lakshmana era

11 A second almanac, dated in Lakshmana Samvat 732, gave the equivalent dates of Sake 1762, and Vikrama Samvat 1897, both corresponding with A D 1840 Deducting 731 we get A D 1109 = the year 1 of the Lakshmana era

12 A third almanac, dated in Lakshmana Samvat 773, gave Saka 1802 as the equivalent corresponding with A D 1880 Deducting 772, we get 1108 = the year 1 of the era

13 A fourth almanac, dated in Lakshmana Samvat 730, gave Vikrama Samvat 1895 corresponding with A D 1838 Deducting 729 we get 1109 A.D. = the year 1 of the era

On comparing the dates derived from the almanacs, it will be seen that not only do they differ amongst themselves, but there is not one of them that agrees with the date derived from the copper-plate inscription, which places the year 1 of the era in A D 1107 These various dates are as follow —

No	1	Colebrooke	A D	1796 = 692	L S	or	A D	1105 = 1
„	2	Buchanan	„	1810 = 706	„	or	„	1105 = 1
„	8	Do	„	1810 = 705	„	or	„	1106 = 1
„	6	Copper-plate	„	1399 = 293	„	or	„	1107 = 1
„	9	Almanac	„	1874 = 767	„	or	„	1108 = 1
„	10	Do	„	1776 = 669	„	or	„	1108 = 1
„	12	Do	„	1880 = 778	„	or	„	1108 = 1
„	11	Do	„	1840 = 732	„	or	„	1109 = 1
„	13	Do.	„	1838 = 730	„	or	„	1109 = 1

The differences are not very great, but in dealing with the establishment of an era, the strictest accuracy is imperatively necessary. What may be the cause of these differences I can only guess at. I notice that Buchanan refers the beginning of the year to the full moon of Ashâdha.* But I was informed in Tirhut that the Lakshmana Samvat

* Eastern India, III, 189.

begins with 1st Mâgha-Badi, while both the Vikrama and Saka years begin with the 1st Chaitra-Sudi Babu Râjendra also states that the Lakshmana year is a luni-solar one, "commencing from the 1st of the month of Mâgha," that is, *Mâgh-Badi* 1, or middle of January

Before closing this account I must notice a very serious error into which Babu Râjendra has fallen about Lakshmana Sena himself After having translated the Buddha Gaya inscription dated in S 74, which declares that the era of Lakshmana Sena began "after the expiration" of his reign, he on the very next page makes the era date from the beginning of his reign * Thus he says, "*Beginning* with (A.D) 1106 Lakshmana had a very prosperous reign of many years" And again he says, "A period of 30 years would not be too much and Lakshmana's reign may very fairly be assumed to have extended to the close of the fourth decade of the 12th Century" So that the year 1706 A D was both the *beginning and the end of Lakshmana's reign* Again on page 402, in his list of the Sena Rajas, he gives A D 1106 as the beginning of Lakshmana's reign Lastly, in page 397, in speaking of the Tarpondighi inscription, which is dated in the 7th year of Lakshmana's own reign, he notes that no attempt had been made to trace the initial date of the era.

How the learned Babu came to the conclusion that the year A D 1106 was the beginning of Lakshmana Sena's reign I cannot even guess He himself publishes the notice that the *Dâna-Sâgara* was written in Saka 1019, A D 1097, by Halâyudha, the spiritual adviser of Lakshmana Sena This alone is sufficient to establish the fact that Lakshmana Sena was reigning at least nine years before the adoption of his era But there is another fact recorded by one of the earliest Muhammadan historians, Minhaj-ue-Siraj, which points very clearly to an earlier period for the reign of Lakshmana Sena This is the statement that Lakshmaniya, the last Hindu king of Gaur, had reigned for 80 years previous to the conquest of Bengal by Bakhtiyar Khalji in A.D 1195

---

* Bengal Asiatic Society's Journal, 1878, p. 398.

XXII.—SIVA-SINGHA SAMVAT

— o —

THIS era is known only from its mention in Colonel Tod's inscription from Balabhi From the discussion on the date of this inscription in my account of the Balabhi era, it will be seen that its initial point corresponds with A D 1114 It seems probable that it may refer to the expulsion of the Jaina Rajas from the Peninsula of Gujarat

XXIII.—FASLI ERA OF BENGAL.

THE *Fasli* Era owes its origin to Akbar's love of innovation It should properly be dated from the time of his own accession, or the 2nd of Rabi-us-Sâni in the Hijra year 963, or 14th February 1556, but the actual solar reckoning of the Fasli system in Bengal begins with the 1st Vaisâkh of the Hindu solar year, on Saturday the 28th March, O S, or Saturday the 6th April, N S * In the account published by James Prinsep, the different reckonings of the Fasli calendar in various parts of India are all noticed It is altogether a mongrel era, the first 963 years being purely lunar ones of the Hijra Calendar, after which the years are purely solar ones, the Bengâli sanh beginning with the 1st of the Hindu Vaisâkh, the Fasli of Northern India with the 1st of the lunar Aswina, and the Vilayati with the 1st of the solar Aswina

There is also a later Fasli *era* in the Dakhin, which was established by Shah Jahân in A.D 1636 or at 1046 The beginning of the year has been fixed by the Madras Government to the 12th of July

---

* James Prinsep gives 11th April 1556 as the 1st of Vaisâkh, but this is clearly a mistake, as his own Tables give the same date for the beginning of the Fasli year in 1856. — *Useful Tables*, p. 36

XXIV.—ILÂHI ERA

—o—

THE *Târikh Ilâhi*, or "Ilâhi Era," was established by Akbar so late as the 30th year of his reign in A H 992, or A D 1584 The courtly Abul Fazl says, that it was established "in order to remove the perplexity that a variety of dates unavoidably occasions He disliked the word *Hijra* (flight), but was at first apprehensive of offending ignorant men, who superstitiously imagined that this era and the Muhammadan faith were inseparable" "Amir Fateh-Ullah Shirâzi corrected the calendar from the tables of Ulugh Beg, making this era to begin with His Majesty's reign, and contemplating the character of the monarch, named it *Târikh Ilâhi*, or the Mighty Era." "The years and months are both natural solar, without any intercalations The names of the months and days correspond with the ancient Persian The months are from 29 to 30 days each There is not any week in the Persian month, (the) 30 days being distinguished by different names, and in those months which have 32 days, the last two are named *Roz-o-Shab* (day and night), and in order to distinguish one from the other are called first and second"

The Ilâhi era dates from Akbar's accession to the throne, which, according to the Tabakât-i-Akbari, was Friday the 2nd of Rabi-us-Sâni, A.H 963, or 15th February 1556, O S* It was employed extensively, though not exclusively, on the coins of Akbar and Jahângir, and appears to have fallen into disuse early in the reign of Shah Jahân Marsden has published a coin of this king with the date of Sanh 5 Ilâhi, coupled with the Hijra date of 1041 But in this case the Ilâhi date would appear to be only the *jalus*, or year of the king's reign †

In the account quoted above from Abul Fazl, which Prinsep has also copied, the lengths of the months are said to be "from 29 to 30 days each," but in the old Persian Calendar of Yazdajird, they were

* Nizâmuddin in Elliot's Muhammadan Historians, V, p 241
† Numismata Orientalia, Vol II, p 640

30 days each, the same as amongst the Parsis of the present day The names of the twelve months, all of which are found on the coins, are as follows —

1 —Farwardin	5 —Mirdâd	9 —Ader
2 —Ardi-behisht	6 —Shariur	10 —Dê
3 —Khurdâd	7 —Mihir	11 —Bahman
4 —Tîr	8 —Abân	12 —Isfandarmaz

The Ilâhi era, as well as the old Persian era, had a different name for each of the 30 days of the month—

		Days			
1	Hormazd	11	Khurshîd	21	Ram
2	Bahman	12	Mhor	22	Guvâd
3	Ardi behisht	13	Tir	23	Depdin
4	Shatiur	14	Gosh	24	Din
5	Aspandâd	15	Depmehel	25	Ashasang
6	Khurdâd	16	Mihir	26	Ashlâd
7	Amerdâd	17	Serosh	27	Asmân
8.	Depâdar	18	Rashne	28	Zamiâd
9	Adur	19	Farwardin	29	Maharesphand
10	Abân	20	Bahrâm	30	Anirâm

The following is Abdul Kâdir's account of the establishment of this era * "The era of the Hijra was now abolished, and a new era was introduced, of which the first year was the year of the Emperor's accession (963). The months had the same name as at the time of the old Persian kings, and, as given in the *Niçabuççibyan*, fourteen festivals also were introduced corresponding to the feasts of the Zoroastrians, but the feasts of the Musalmans and their glory were trodden down, the Friday prayer alone being retained, because some old, decrepit, silly people used to go to it The new era was called Târikhi Ilâhi, or 'Divine Era' On copper coins and gold-mohurs the era of the Millenium was used, as indicating that the end of the religion of Muhammad, which was to last one thousand years, was drawing near"

I have read somewhere that in A H 992, when the Hijra millenary began to draw towards its close, and Akbar was meditating the establishment of the Ilâhi era, one of his courtiers stated openly that the eras even of the greatest kings did not last beyond 1,000 years In proof of this he cited the extinction of some Hindu era, which was abolished at the end of 1,000 years

* Blochman's Ain-i-Akbari, p 195

XXV —CHRISTIAN ERA

—o—

THE era which has been adopted by all Christian nations is reckoned from the supposed date of the birth of Christ, and has, therefore, been called *Anno Domini*, or the "year of our Lord" The era was first brought into use by Dionysius Exiguus, a Roman Abbot, who fixed the birth of Christ in the 45th year of the Julian era, or A U C 753 of the *Roman Calendar* "*Previous to this, the Christian Churches had for about* a century dated from the Diocletian era, or year of Martyrs" The true date of the nativity is now admitted to be four years earlier, or in 4 B C of the present Christian reckoning But the use of the Christian era did not become general until A D 730, in the time of Pope Gregory II

The year was the same as the Julian year, and consisted of 365¼ days, the fraction being arranged by making three consecutive years of 365 days, and adding a whole day to the 4th year But after the lapse of many centuries it was discovered that this value of the solar or sidereal year was too much In A D 1582, when the amount of excess was ten days, the calendar was corrected by order of Pope Gregory XIII by striking out ten days in October from the 5th to the 14th In England the correction was not made until A D 1752, when, the error having still further increased, eleven days were struck out from 3rd to 14th September The true length of the year is 365 24219 days, but for convenience it is made 365 2425 days, or three days less than the Julian reckoning in 400 years This is effected by omitting the extra day in the three odd hundred periods of four centuries Thus the years 1600 and 2000 are leap years, but 1700, 1800 and 1900, are common years

The accompanying tables for ascertaining the week day of any date either before or after Christ, and according to either the Julian or Gregorian reckoning, were prepared by myself more than twenty years ago Since then I have had ample opportunities of testing their useful-

ness in facilitating the very common operation of finding the week day of any given date According to my experience, their use is both more rapid and less troublesome than any others that I have tried Every week day is shown at once by simple inspection I have also invented the following short process for finding the initial day of any year of the Old Style or Julian reckoning

Rule—Set down the date and add one-fourth, rejecting fractions. Deduct two years, if leap year, but only one year if an ordinary one. Divide by 7, and the remainder, counted from Sunday as 1, will be the initial day of the year The following examples will be sufficient. Both results agree with the table—

A D 1600, leap year	A D 1625, ordinary year
÷ 4	÷ 4
400	406
2000	2031
− 2	− 1
1998	2030
÷ 7	÷ 7
285+3 = Tuesday	290 = Saturday

There is an old memorial verse, which is much used for ascertaining the initial day of each month when the initial day of the year is known The capital letters are the Dominical letters showing the days of the week, counting from Sunday as 1

At Dover Dwell George Bruce, Esquire,
Good Christopher Finn, And David Fryer

Here we see at once the initial day of each month But as the same may also be obtained at once from an inspection of the table, the chief use of this memorial verse is when the table is not at hand

The tables themselves are so clear and simple that they scarcely require any explanation But suppose it be required to find the week day of the 20th October 1712 A D First look in Table III of the Julian Calendar for the year 1700 A D, then run the eye down until it meets the horizontal line opposite of the year 12, and the intersection will show the initial day of the year 1712 as Tuesday Next look in Table II at top for the horizontal line of week days, beginning with Tuesday, which is the third one of the seven, and as 1712 was a leap year, look for the name of October in the right hand column. Then,

taking the 20th day of October, and running the eye upwards until it meets the horizontal line of week days, of which Tuesday was the 1st of January in that year, it will be seen that Monday was the 20th of October, as recorded at the head of the Spectator "Monday, October 20th, 1712."

As a second example let it be required to find the week day of the 7th November 1752 after the Gregorian reckoning or New Style had been adopted in England First look in Table IV of the Gregorian Calendar for the initial day of A D 1752, which will be found to be Saturday Then with this as the first day of January look in Table II as before for the month of November and the seventh day, which will be Tuesday The Adventurer is dated "Tuesday, Nov 7th, 1752"

As a last example, I will take a still earlier date recorded by Bacon, '1617, Feby 6th, Friday" Here the date being prior to the 25th March the true year was 1618, as now reckoned The initial day in Julian reckoning was Thursday, and the year being an ordinary one, the names of the months must be read from the left side of Table II, which gives Friday as the 6th February 1618.

XXVI.—SAURA-MANA;

OR

SOLAR RECKONING

THEORETICALLY the Hindu solar year should begin with the sun's entrance into Aries, but owing to the greater length of the Hindu year, the 1st of Vaisâkh has gradually receded, so that the first day of the solar year now falls on the 12th or 13th of April The Indian computations were all made from the beginning of the Mahâ-Yuga, and owing to the difference in the length of the solar year as laid down by Aryabhatta and Varâha Mihira, there is often a discrepancy of one day in the beginning of the Hindu year in the places which make use of their different tables The actual difference is, however, not so much, being only about one-third of a day in 4000 years According to Warren the number of days assigned by Aryabhatta to a Mahâ-Yuga of 4,320,000 years is 1,577 917,500 in the south of India, and 42 more in the MSS preserved in Bengal The former gives a year of 365 2586805 days, and the latter of 365 258692 days* But the Surya Siddhânta of Varâha Mihira gives 1,577 917,823 days to the Mahâ-Yuga, which makes the year somewhat longer, or 365 2587564 days

As the number of revolutions was complete at the beginning of the Kâli-Yuga, it is not necessary to go back, as the Hindu astronomers do, to the beginning of the Mahâ-Yuga It will be sufficient to begin the computation from the commencement of the Kâli-Yuga itself In the accompanying Tables, Nos XI, XII, and XIII, I have given the number of days elapsed from the beginning of the Kâli-Yuga down to K Y 5100, according to both computations now in use, that of the Surya Siddhânta in Northern India and that of Aryabhatta in Southern India The fractions of days are given in the convenient form of decimals instead of the troublesome *ghatis, palas,* and *vipalas* of the native astronomers

As an example of the working of the Tables I will take the year A D 1857, to find on what day the 1st Vaisâkh fell According to the

---

* Bentley, p 149, makes the Bengali year slightly different as 365 258690 days.

Surya Siddhânta reckoning, the Kâli-Yuga year 4958 (or 3101+1857) began on the 11th of April, while Warren's Tables also give the same date. The process in both reckonings is as follows.—

	Surya Siddhânta		*Arya Siddhânta*
Years		Days.	Days.
4900	contain	1 789,767·9067	1 789,767 5346
58	„	21,185 0078	21,184 9934
4958	contain	1 810,952 9145	1 810,952 5280
Deduct constant		— 2 1475	— 2 1475
		1 810,950 7670	1 810,950·3805

After striking out the weeks by dividing both by 7, there remains
1 7 days over, and 1 3 days over

As the week days are counted from Friday, the first day following was Saturday, which in the year 1851 A D was the 11th of April Should the large fraction of 767 of a day be reckoned as a whole day, then the initial day of the solar year in Northern India would be Sunday, 12th April 1857, and this I find is the actual date given for Bengal in the Calcutta Gazetteer of that year

The initial day of the year having been fixed, it is a very simple process to find any particular day of a given month, by an inspection of the Table of solar months, with the collective number of days for the whole year The months themselves are of varying lengths with broken periods, but for the calendar they are made to consist of whole numbers Then suppose it be required to find the day of the Christian year corresponding with the 10th of Kartika of the solar year 4958, Kâli-Yuga, a reference to the Table will show that the day required is the 197th day of the year, which is to be reckoned from the 12th of April as the first day A reference to the Christian Table of days shows that the 12th of April is the 71st day, to which adding 196, we get the 267th day of the Christian year, or the 22nd of November 1857.

XXVII.—CHANDRA-MÂNA.

—o—

THE *Chandra-Mâna*, or luni-solar calendar of the Hindus, is a much more elaborate system of reckoning The object of the Chandra-Mâna is to combine the solar and lunar reckonings, so that the years may be reckoned by the course of the sun, while the months are regulated by the revolutions of the moon For this purpose a cycle of 19 solar years was adopted, as being equal, or nearly so, to 235 lunations or revolutions of the moon of 29 5306 days The periods do not quite tally, as 19 solar years are equal to 6939 9163 days according to Varâha Mihira, and 6939 9149 days according to Aryabhatta, while 235 lunations are equivalent to only 6939 6910 days The difference is nearly one-fourth of a day in 19 years

The year consists of 12 lunar months of 30 and 29 days alternately, making altogether 354 days The deficiency of eleven days less than the solar year, is made good by the addition of seven intercalary months in each cycle of 19 years, which are inserted in the

3rd, 5th, 8th, 11th, 14th, 16th, 19th years.

As these intercalary months also consist of 30 or 29 days, the cycle of 19 years is thus made to consist of $19 \times 12 = 228 + 7 = 235$ lunations. The Hindu luni-solar year, therefore, agrees very closely with the Greek cycle of Meton, which also consisted of 19 solar years, or 235 lunations The seven intercalary months of Meton were inserted in the following years

3, 5, 8, 11, 13, 16, 19

The only difference between this arrangement and that of the Hindu series is in the 5th interçalation, which was made in the 14th instead of in the 13th year But in spite of this close agreement, I

think it almost certain that the two cycles were independently developed, although they may perhaps have had a common origin The difference in the *mode* of intercalation is so great that it seems quite impossible that one can have been borrowed from the other In the Greek cycle, the intercalary month has a fixed position, while in the Indian cycle both the name and the position are constantly changing The name of the intercalary month is determined in the following manner—"When two new moons fall within the same solar month, as for instance on the 1st and 30th of Chaitra, then the name of Chaitra, or the corresponding lunar month, is repeated, the year being then intercalary with 13 months The extra month is called *adhika* (or added), and the other *nya* (or ordinary). By the rule of the Surya Siddhânta, the intercalated month is to be placed in the middle of the ordinary month In Southern India the whole intercalary month is placed before the ordinary one

The common rule followed for intercalation is thus given by Warren. When the luni-solar year begins—

On the 1st of the solar Chaitra, then	*Chaitra*	will be intercalary
On the 2nd or 3rd	Vaisâkha	,,
On the 4th or 5th	Jyeshtha	,,
On the 6th, 7th, or 8th	Srâvana	,,
On the 9th or 10th	Bhâdrapad	,,

"It happens once within each term of 160 years that there is no new moon in one of the last six lunar months, which from the sun being in perigee contain only 30 and 29 days each" "To obviate this, that month is expunged, while two others for the opposite cause are repeated. *This double intercalary year with its expunged month is* called *Kshaya Samvat-sara.*"

In the General Table, which gives the names of the intercalary and expunged months, I have adopted the calendar published by Cowasjee Patell. The initial days of the years I have calculated myself throughout up to A D 540 The early calculations have been made with the solar reckoning of Aryabhatta but from 541 down to the end, according to the solar reckoning of Varâha Mihira Cowasjee Patell's Tables are calculated according to Aryabhatta, whose reckoning is still used in Southern India

As the luni-solar year begins with the new moon immediately preceding the 1st of the solar Vaisâkh, the first step to be determined is the number of days by which the one precedes the other. For this purpose the beginning of the solar year has to be fixed, as already shown

in the account of the Saura-Mâna, using the Solar Ahargana of the Surya Siddhânta for the North Indian dates and Aryabhatta's Solar Ahargana for South Indian dates. The next step is to find the number of days of the luni-solar Ahargana in the given period, and to deduct this total from the number of days of the Solar Ahargana already found. The remainder is to be reduced by continued subtraction of whole lunations, until the last remainder is less than one lunation. Then that last remainder shows the exact number of days by which the new moon precedes the 1st day of the Solar Vaisâkh.

As an example of the process I will take the date of Kâli-Yuga 4958. or A D 1857, of which the initial days have already been found in my account of the Saura-Mâna or solar reckoning As the Luni-Solar Ahargana of the Surya Siddhânta is used in the South as well as in the North, one process will be sufficient—

4900 years of luni solar reckoning	=	1736,398 5710 days
58 „ „	=	20,553 2892
4958 years	=	1756,951 8602 days
Deduct from the Solar Ahargana already found for N India		1810,950 7670 days
Difference		53,998 9068 days
Deduct 1800 lunations		53,155 0582
		843 8486
Deduct 28 lunations		826 8564
Days		16 9922

The new moon, therefore, precedes the beginning of the solar year by 16 99, or 17 days Then as the 1st of the Solar Vaisâkh fell on the 11th of April 1857 in North India, the new moon will have fallen on the 24th March, and the beginning of the luni-solar year, or the 1st Chaitra-Sudi, on the following day or 25th March In Southern India it would have been the same according to my reckoning from Aryabhatta's length of the solar year, and this also is the day given by Warren But according to Cowasjee Patell, it was the 26th March.

I have tested these Tables for several dates at distant intervals and have found them correct—

1 On the 5th February B C 21 there was an eclipse visible in India By the Tables the first day of the solar year was Wednesday,

14th March, and the first day of the luni-solar year was Tuesday the 6th March, from which date counting backwards 29½ days for the previous conjunction of the sun and moon, we get the 5th February

2 In A D 314, on the 3rd of March, there was a *grand eclipse* of the sun visible over E Asia. According to Cowasjee Patell, the first day of the luni-solar year A D. 314 was the 3rd of March

3 In A D 490, on the 7th March, there was an eclipse of the sun visible over S E. Asia According to Cowasjee Patell, the first day of the luni-solar year was the 8th March, which is right according to the rule that the first day of the new year is the day after the conjunction.

4 On the 4th March 1840, I saw an eclipse of the sun in N. India According to Cowasjee Patell, and also according to my own reckoning, the luni-solar year began on the 3rd April 1840, which is exactly one conjunction later

5 In my account of the Bârhaspatya-Mâna, I have given another example of the correct working of the Tables for an eclipse of the year 792 A.D, which is mentioned in one of the Indian inscriptions

6 But perhaps the most striking illustration of the general accuracy of the Tables is the eclipse of the moon, which is recorded to have happened in the month of Srâvana Samvat 1200 The inscription in which this is found is one of "three grants of land found at Ujjayani," on which Colebrooke makes the following remarks *

"One of three grants or patents records a donation of land made by the reigning sovereign of Dhârâ, on the anniversary of the death of his father and predecessor, in 1191 of the Samvat era, confirmed by the prince, his son, at the time of an eclipse of the moon in Srâvana 1200 Samvat It appears from calculation that a lunar eclipse did occur at the time—*viz*, on the 16th of July A D 1144, about 9½ P M, apparent time at Ujjayani"

Now it is quite true, as Colebrooke says, that an eclipse of the moon did occur on the 16th July 1144, but that day was certainly not the full moon of Srâvana in that year The true date was the 28th

* Colebrooke's Essays, II, p 264 He has used the erroneous equation of 56 instead of 57 to reduce the Samvat year to Christian reckoning

July 1143, on which day was the full moon of Srâvana, and also a lunar eclipse The following is the calculation according to the Tables Samvat year 1200 + 3044 = 4244 Kâli-Yuga = A D 1143

Solar Ahargana		*Luni-solar Arhargana*
4200 years =	1534,086 7772 days	1488,341 6923 days
44 years =	16,071 3852 „	15,592 1504 „
4244 years =	1550,158 1624 days	1503,933 7827 days
Deduct constant	2 1475	
	1550,156 0149	+ 7 leaves 6 days over = Thursday, 25th March, O S,
Luni-solar Ahargan	1503,933 7827	for first day of solar year
	46,222 2322	
1500 Lunations	44,296 8820	The full moon of Srâvana or Srâvana Sudi 15th
	1926 3502	is the 193rd day of the Hindu year,
	1919 4882	which, counted from Thursday the 25th March, gives 28th July A D
6 86 = 7 days earlier	6 8620	1143, on which day there was an eclipse of the moon

In the North the luni-solar year begins with the new moon, or 1st day of *Chaitra-Sudi*, and as this is the latter half of the month, this Hindu year has the strange anomaly of beginning in the middle of a month The first half of Chaitra, or the period of the waning moon, called *Badi*, or *Krishna Paksha*, belongs to the past year This mode of placing the *Badi*, or waning half of the moon, in the beginning of the month is known as the *Krishnadi* reckoning, while the opposite practice of putting the *Sudi*, or *Sukla Paksha*, half of the moon, as the beginning of the month, is known as the *Sukladi* reckoning. The names *Badi* and *Sudi* are contractions of *bahula-paksha-dina*, the "day of the dark half," and *sukla-paksha-dina*, the "day of the bright half," the first and last syllables only being retained

Table X shows the number of days in the Hindu luni-solar year when not intercalary When the year is an intercalary one, and the day required falls later than the intercalary month, then 30 days must be added to the number given in the Table

The years of intercalation being fixed by the rules laid down for the 19-year cycle, the name of the intercalated month has yet to be found As there are 30 days in six of the lunar months, while the time of one lunation is only 29½ days, it would of course occasionally happen that two new moons would fall in the same month, one at the beginning, and the other at the end But as this is not allowed, a

peculiar arrangement has been adopted for avoiding it. In whatever month two new moons would naturally fall, that month is doubled; or, in other words, an intercalary month of the same name is added called Adhika Vaisâkha, Adhika Srâvana, &c

To ascertain which month will be Adhika, or intercalary, Warren's Kâla Sankalita should be consulted, and also the brief abstract given by Prinsep The process is troublesome, and in the present work I have adopted the names of the intercalary months as given by Cowasji Patell The years of the intercalations are shown to be correct by the shifting of the initial days backwards and forwards, all of which I have myself calculated

TABLE XIX

THE DAKHINI CYCLE OF JUPITER.

The Jovian cycle of 60 years, as used in Southern India, is a simple period of 60 solar years, in which year has a separate name. There are no omitted years as in the Northern reckoning, and the cycle has no longer any connection with Jupiter's revolution The cycles begin in the following years A D, with the year named Prabhava

A D	7	—	—	—	—	—	—
	67	367	667	967	1267	1567	1867
	127	427	727	1027	1327	1627	1927
	187	487	787	1087	1387	1687	1987
	247	547	847	1147	1447	1747	2047
	307	607	907	1207	1507	1807	2107

The names of the 60 years of the cycle of Jupiter are the same both in Northern and Southern India They are as follows —

1	Prabhava	16	Chitrabhanu	31	Hemalamba	46	Paridhâvin
2	Vibhava	17	Subhânu	32	Vilambin	47	Pramâdin
3	Sukla	18	Târana	33	Vikârin	48	Ananda
4	Pramoda	19	Pârthiva	34	Sarvari	49	Râkshasa
5	Prajapati	20	Vyaya	35	Plava	50	Anala
6	Angiras	21	Sarvajit	36	Subhakrit	51	Pingala
7	Srimukha	22	Sarvadhârin	37	Subhakrit	52	Kalayutka
8	Bhava	23	Virodhin	38	Krodhin	53	Siddhartha
9	Yuvan	24	Vikrita.	39	Viswâvasu	54	Raudra
10	Dhatar	25	Khara	40	Parâbhava	55	Durmati
11	Iswara	26	Nandana	41	Plavanga	56	Dundubhi
12	Bahudhanya.	27	Vijaya	42	Kilaka	57	Uda
13	Pramathin	28	Jaya	43	Saumya	58	Rudhirâksha
14	Vikrama	29	Manmatha	44	Sâdharana	59	Krodha
15	Vrisha	30	Durmukha	45	Virodhakrit	60	Kshaya

As an example of the use of this Dakhini cycle, I may cite the date of the Kurda inscription (Royal Asiat Soc Jour, III, 104), which is recorded as Sake 894 (A D 972), with the Jupiter year named Angiras As this is the 6th name, we obtain the date intended by adding 5 years to the 1st year of the cycle, which began previously to A D 972 This is A D 967, to which adding 5 we get 972 A D, in exact accordance with the Sake date of 894

TABLE XX.

INITIAL DAYS OF ILAHI YEARS.

The Ilahi is a true solar year beginning with the Nauroz (in March) The initial days in the Hijra reckoning are taken from Dowson's Table as given by Abul Fazl The corresponding Christian dates have been calculated, and a few palpable errors have been corrected

Ilahi	Months		A H	March		A D
1	27	Rabi II	963	Tues	10	1556
2	9	Jumadi I	964	Wed	10	1557

49	17	——	1012	Frid	9	1604
50	28	——	1013	Sat	9	1605

TABLE XXI.

THE ABJAD.

A favourite mode of recording Hijra dates is by the numerical values of the letters in some short phrase, or chronogram, descriptive of the event commemorated This system is called *Abjad*, from the first four letters of the Hebrew alphabet, from which the scheme was borrowed, namely, *a b, j, d.* The whole scheme is as follows —

Letters	Values	Letters.	Values	Letters	Values
a	1	*i*	10	*k*	100
b	2	*k*	20	*r*	200
j	3	*l*	30	*sh*	300
d	4	*m*	40	*t*	400
h	5	*n*	50	*s*	500
o w	6	*s*	60	*kh*	600
z	7	*a m*	70		
h	8	*f*	80	*z*	700
t	9	*s w*	90	*z w*	800
				z	900
				g h	1000

Occasionally the chronograms were very terse ly and happily expressed, and the fortunate inventors were usually rewarded very liberally The following are rather favourable specimens of these *Abjad* chronograms

1 — *Wafât Firoz* records the "Death of Firoz" in A. H 790

2 —*Masjid Jâmi ul Shark* records the building of the Great Mosque at Jaunpur in A H 852

3 —*Az âtash murd*, "he died by fire," records the date of the death of Sher Shah, who was killed at the siege of Kâlinjar by the bursting of a shell

4 —*Zawâl Khusroan*, or the "Ruin of the Kings," was invented by Ghulam Ali Hindu Shah, the father of the historian Ferishta, to commemorate the deaths, in A H 961, of the three kings,*

Mahmud Shâh of Gujarât
Burhân Nizâm Shah of Ahmednagar
Islâm Shâh, Sur, of Delhi

5 —*Pul Muhammad Mu nim Khan*, or "Bridge of Muhammad Munîm Khan," at Jaunpur, gives the date A H 975

---

* Briggs Ferishta, Vol IV, 152 Islam Shah died within a few days of the end of A H 960

6.—In the old town of Hilsa in Bihâr, near the tomb of the holy Saint Jaman Madâri, there is an upright stone with the date of A H 1013, recorded in four different ways, as follows *

In Arabic	alf wa sulś ashr = 1000 + 3 + 10	= 1013 A H
„ Persian	hazâr wa sis dah = 1000 + 13	= 1013 „
„ Numerals	1013	= 1013 „
„ Abjad	d w b a zw ż	
Values below	4 + 6 + 2 + 1 + 800 + 200	= 1013 „

The values of the Abjad letters are engraved on the stone in numerals immediately below the letters

* See Archæological Survey of India, Vol XI 164
